Description/Features

The 50SQ, 100V Schottky family employs the "830" process which results in a very low ratio of reverse leakage current to junction temperature. In addition to improvements in reliability and performance, it is a rugged device with a guaranteed repetitive peak reverse voltage capability and excellent ability to withstand reverse energy transients. It can be used in both existing and new designs.

- V_{RWM} 30 to 100 Volts
- Ultra fast switching
- Extremely low V_F
- Economical axial lead package
- $T_J = 150^\circ\text{C}$ (rep.), $T_J = 175^\circ\text{C}$ (non-rep.)
(T_J is limited to 150°C because of plastic case)
- Extremely low reverse leakage: 13 mA at 125°C
- No voltage derating on V_{RWM} over temperature range
- Provides extremely high power supply reliability
- No thermal runaway at rated temperature and operating parameters
- A guaranteed repetitive peak reverse voltage capability for short pulses which is 20% above V_{RWM}
- Ability to withstand reverse energy transients

Notes: A. Maximum allowable heatsink thermal resistance, R_{thLA} , equals the graph value minus the ΔR_{th} factor which allows for instantaneous T_J excursion. At frequencies above 5000 Hz, ΔR_{th} becomes essentially zero and can be ignored.

B. The total power dissipation curves assume the worst case reverse conditions of half wave (180 $^{\circ}$) rectangular reverse voltage, full rated V_{RWM} , and $T_J = 150^{\circ}\text{C}$. Lower reverse power losses allow higher operating ambient, smaller heatsinks or larger operating safety margin.

C. Caution: Data assumes that the rectifier is mounted with heatsinks attached to the leads at a maximum of 3/8 of an inch (9.5 mm) from the ends of the body of the rectifier.
