74LVX373 Low Voltage Octal Transparent Latch with TRI-STATE® Outputs

74LVX373 Low Voltage Octal Transparent Latch with TRI-STATE® Outputs

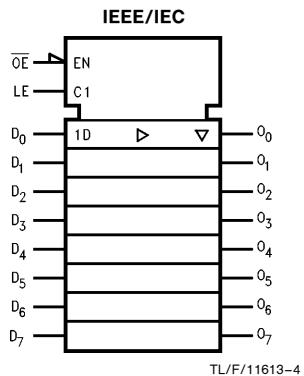

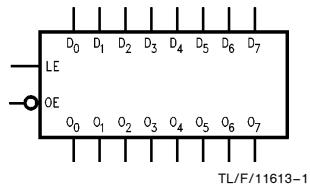

General Description

The LVX373 consists of eight latches with TRI-STATE outputs for bus organized system applications. The latches appear transparent to the data when Latch Enable (LE) is HIGH. When LE is low, the data satisfying the input timing requirements is latched. Data appears on the bus when the Output Enable (OE) is LOW. When OE is HIGH, the bus output is in the high impedance state. The inputs tolerate up to 7V allowing interface of 5V systems to 3V systems.

Features

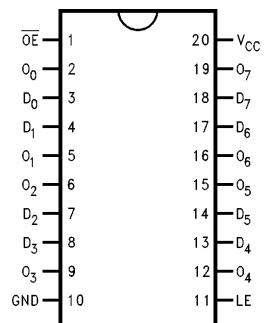

- Input voltage translation from 5V to 3V
- Ideal for low power/low noise 3.3V applications
- Available in SOIC JEDEC, SOIC EIAJ and TSSOP packages
- Guaranteed simultaneous switching noise level and dynamic threshold performance

Functional Description

The LVX373 contains eight D-type latches with TRI-STATE standard outputs. When the Latch Enable (LE) input is HIGH, data on the D_n inputs enters the latches. In this condition the latches are transparent, i.e., a latch output will change state each time its D input changes. When LE is LOW, the latches store the information that was present on the D inputs a setup time preceding the HIGH-to-LOW transition of LE. The TRI-STATE standard outputs are controlled by the Output Enable (\overline{OE}) input. When \overline{OE} is LOW, the standard outputs are in the 2-state mode. When \overline{OE} is HIGH, the standard outputs are in the high impedance mode but this does not interfere with entering new data into the latches.

Truth Table

L	L	X	O_0

H = HIGH Voltage Level

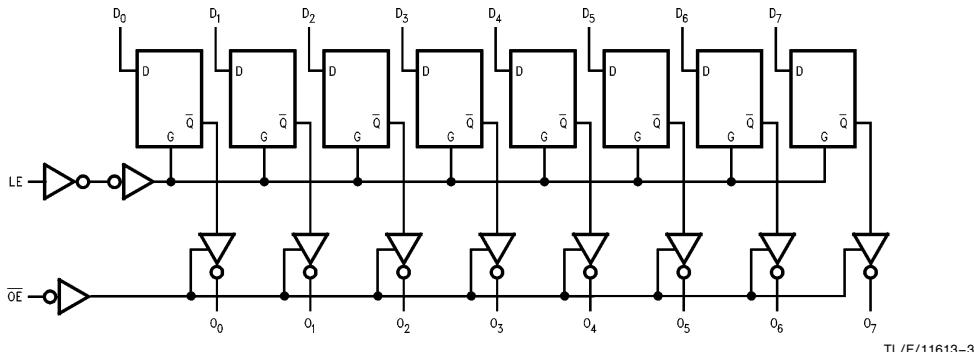

L = LOW Voltage Level

Z = High Impedance

X = Immortal

O_0 = Previous O_0 before HIGH to Low transition of Latch Enable
