1. Peripherals

The AT8xC51SND1C peripherals are briefly described in the following sections. For further details on how to interface (hardware and software) to these peripherals, please refer to the AT8xC51SND1C design guide.

1.1 Clock Generator System

The AT8xC51SND1C internal clocks are extracted from an on-chip PLL fed by an on-chip oscillator. Four clocks are generated respectively for the C51 core, the MP3 decoder, the audio interface, and the other peripherals. The C51 and peripheral clocks are derived from the oscillator clock. The MP3 decoder clock is generated by dividing the PLL output clock. The audio interface sample rates are also obtained by dividing the PLL output clock.

1.2 Ports

The AT8xC51SND1C implements five 8-bit ports (P0 to P4) and one 4-bit port (P5). In addition to performing general-purpose I/O, some ports are capable of external data memory operations; others allow for alternate functions. All I/O Ports are bidirectional. Each Port contains a latch, an output driver and an input buffer. Port 0 and Port 2 output drivers and input buffers facilitate external memory operations. Some Port 1, Port 3 and Port 4 pins serve for both general-purpose I/O and alternate functions.

1.3 Timers/Counters

The AT8xC51SND1C implements the two general-purpose, 16-bit Timers/Counters of a standard C51. They are identified as Timer 0, Timer 1, and can independently be configured each to operate in a variety of modes as a Timer or as an event Counter. When operating as a Timer, a Timer/Counter runs for a programmed length of time, then issues an interrupt request. When operating as a Counter, a Timer/Counter counts negative transitions on an external pin. After a preset number of counts, the Counter issues an interrupt request.

1.4 Watchdog Timer

The AT8xC51SND1C implements a hardware Watchdog Timer that automatically resets the chip if it is allowed to time out. The WDT provides a means of recovering from routines that do not complete successfully due to software or hardware malfunctions.

1.5 MP3 Decoder

The AT8xC51SND1C implements a MPEG I/II audio layer 3 decoder (known as MP3 decoder).
In MPEG I (ISO 11172-3) three layers of compression have been standardized supporting three sampling frequencies: 48, 44.1, and 32 KHz. Among these layers, layer 3 allows highest compression rate of about 12:1 while still maintaining CD audio quality. For example, 3 minutes of CD audio (16-bit PCM, 44.1 KHz) data, which needs about 32 MBytes of storage, can be encoded into only 2.7 MBytes of MPEG I audio layer 3 data.
In MPEG II (ISO 13818-3), three additional sampling frequencies: 24, 22.05, and 16 KHz are supported for low bit rates applications.
The AT8xC51SND1C can decode in real-time the MPEG I audio layer 3 encoded data into a PCM audio data, and also supports MPEG II audio layer 3 additional frequencies.

Additional features are supported by the AT8xC51SND1C MP3 decoder such as volume, bass, medium, and treble controls, bass boost effect and ancillary data extraction.

1.6 Audio Output Interface

The AT8xC51SND1C implements an audio output interface allowing the decoded audio bitstream to be output in various formats. It is compatible with right and left justification PCM and I^2S formats and thanks to the on-chip PLL (see Section 1.1) allows connection of almost all of the commercial audio DAC families available on the market.

1.7 Universal Serial Bus Interface

The AT8xC51SND1C implements a full speed Universal Serial Bus Interface. It can be used for the following purposes:

- Download of MP3 encoded audio files by supporting the USB mass storage class.
- In System Programming by supporting the USB firmware upgrade class.

1.8 MultiMediaCard Interface

The AT8xC51SND1C implements a MultiMediaCard (MMC) interface compliant to the V2.2 specification in MultiMediaCard Mode. The MMC allows storage of MP3 encoded audio files in removable flash memory cards that can be easily plugged or removed from the application. It can also be used for In System Programming.

1.9 IDE/ATAPI interface

The AT8xC51SND1C provides an IDE/ATAPI interface allowing connexion of devices such as CD-ROM reader, CompactFlash cards, Hard Disk Drive… It consists in a 16-bit bidirectional bus part of the low-level ANSI ATA/ATAPI specification. It is provided for mass storage interface but could be used for In System Programming using CD-ROM.

1.10 Serial I/O Interface

The AT8xC51SND1C implements a serial port with its own baud rate generator providing one single synchronous communication mode and three full-duplex Universal Asynchronous Receiver Transmitter (UART) communication modes. It is provided for the following purposes:

- In System Programming.
- Remote control of the AT8xC51SND1C by a host.

1.11 Serial Peripheral Interface

The AT8xC51SND1C implements a Serial Peripheral Interface (SPI) supporting master and slave modes. It is provided for the following purposes:

- Interfacing DataFlash memory for MP3 encoded audio files storage.
- Remote control of the AT8xC51SND1C by a host.
- In System Programming.

1.12 2-wire Controller

The AT8xC51SND1C implements a 2-wire controller supporting the four standard master and slave modes with multimaster capability. It is provided for the following purposes:

- Connection of slave devices like LCD controller, audio DAC…
- Remote control of the AT8xC51SND1C by a host.
- In System Programming.

1.13 A/D Controller

The AT8xC51SND1C implements a 2-channel 10-bit (8 true bits) analog to digital converter (ADC). It is provided for the following purposes:

- Battery monitoring.
- Voice recording.
- Corded remote control.

1.14 Keyboard Interface

The AT8xC51SND1C implements a keyboard interface allowing connection of 4 x n matrix keyboard. It is based on 4 inputs with programmable interrupt capability on both high or low level. These inputs are available as alternate function of P1.3:0 and allow exit from idle and power down modes.

2. The differential non-linearity is the difference between the actual step width and the ideal step width (see Figure 22-21).
3. The integral non-linearity is the peak difference between the center of the actual step and the ideal transfer curve after appropriate adjustment of gain and offset errors (see Figure 22-21).
4. The offset error is the absolute difference between the straight line which fits the actual transfer curve (after removing of gain error), and the straight line which fits the ideal transfer curve (see Figure 22-21).
5. The gain error is the relative difference in percent between the straight line which fits the actual transfer curve (after removing of offset error), and the straight line which fits the ideal transfer curve (see Figure 22-21).
