A42U2604 Series

Preliminary

4M X 4 CMOS DYNAMIC RAM WITH EDO PAGE MODE

Features

- Organization: 4,194,304 words X 4 bits
- Part Identification
 - A42U2604 (2K Ref.)
- Single 2.5V power supply/built-in VBB generator
- Low power consumption
 - Operating: 70mA (-50 max)
 - Standby: 0.5mA (TTL), 0.2mA (CMOS), 300µA (Self-refresh current)
- High speed
 - 50/60/80 ns $\overline{\text{RAS}}$ access time
 - 22/27/37 ns column address access time
 - 13/15/20 ns $\overline{\text{CAS}}$ access time
 - 20/24/32 ns EDO Page Mode Cycle Time
- Industrial operating temperature range: -40°C to +85°C for -U
- Fast Page Mode with Extended Data Out
- 2K Refresh Cycle in 32ms
- Read-modify-write, $\overline{\text{RAS}}$ -only, $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$, Hidden refresh capability
- TTL-compatible, three-state I/O
- JEDEC standard packages
 - 300mil, 24/26-pin SOJ
 - 300mil, 24/26-pin TSOP type II package

General Description

The A42U2604 is a new generation randomly accessed memory for graphics, organized in a 4,194,304-word by 4-bit configuration. This product can execute Write and Read operation via $\overline{\text{CAS}}$ pin. The A42U2604 offers an accelerated Fast Page Mode cycle with a feature called Extended Data Out (EDO).

This allow random access of up to 2048(2K Ref.) words within a row at a 50/42/31 MHz EDO cycle, making the A42U2604 ideally suited for graphics, digital signal processing and high performance computing systems.

Pin Descriptions

Symbol	Description
A0 - A10	Address Inputs (2K product)
I/O ₀ - I/O ₃	Data Input/Output
$\overline{\text{RAS}}$	Row Address Strobe
$\overline{\text{CAS}}$	Column Address Strobe
$\overline{\text{WE}}$	Write Enable
$\overline{\text{OE}}$	Output Enable
VCC	2.5V Power Supply
VSS	Ground
NC	No Connection

Selection Guide

Symbol	Description	-50	-60	-80	Unit
t _{RAC}	Maximum $\overline{\text{RAS}}$ Access Time	50	60	80	ns
t _{AA}	Maximum Column Address Access Time	22	27	37	ns
t _{CAC}	Maximum $\overline{\text{CAS}}$ Access Time	13	15	20	ns
t _{oEA}	Maximum Output Enable ($\overline{\text{OE}}$) Access Time	13	15	20	ns
t _{rc}	Minimum Read or Write Cycle Time	84	100	132	ns
t _{pc}	Minimum EDO Cycle Time	20	24	32	ns

Functional Description

The A42U2604 reads and writes data by multiplexing an 22-bit address into a 11-bit(2K) row and column address. $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$ are used to strobe the row address and the column address, respectively.

A Read cycle is performed by holding the $\overline{\text{WE}}$ signal high during $\overline{\text{RAS}}/\overline{\text{CAS}}$ operation. A Write cycle is executed by holding the $\overline{\text{WE}}$ signal low during $\overline{\text{RAS}}/\overline{\text{CAS}}$ operation; the input data is latched by the falling edge of $\overline{\text{WE}}$ or $\overline{\text{CAS}}$, whichever occurs later. The data inputs and outputs are routed through 4 common I/O pins, with $\overline{\text{RAS}}$, $\overline{\text{CAS}}$, $\overline{\text{WE}}$ and $\overline{\text{OE}}$ controlling the in direction.

EDO Page Mode operation all 2048(2K) columns within a selected row to be randomly accessed at a high data rate. A EDO Page Mode cycle is initiated with a row address latched by $\overline{\text{RAS}}$ followed by a column address latched by $\overline{\text{CAS}}$. While holding $\overline{\text{RAS}}$ low, $\overline{\text{CAS}}$ can be toggled to strobe changing column addresses, thus achieving shorter cycle times.

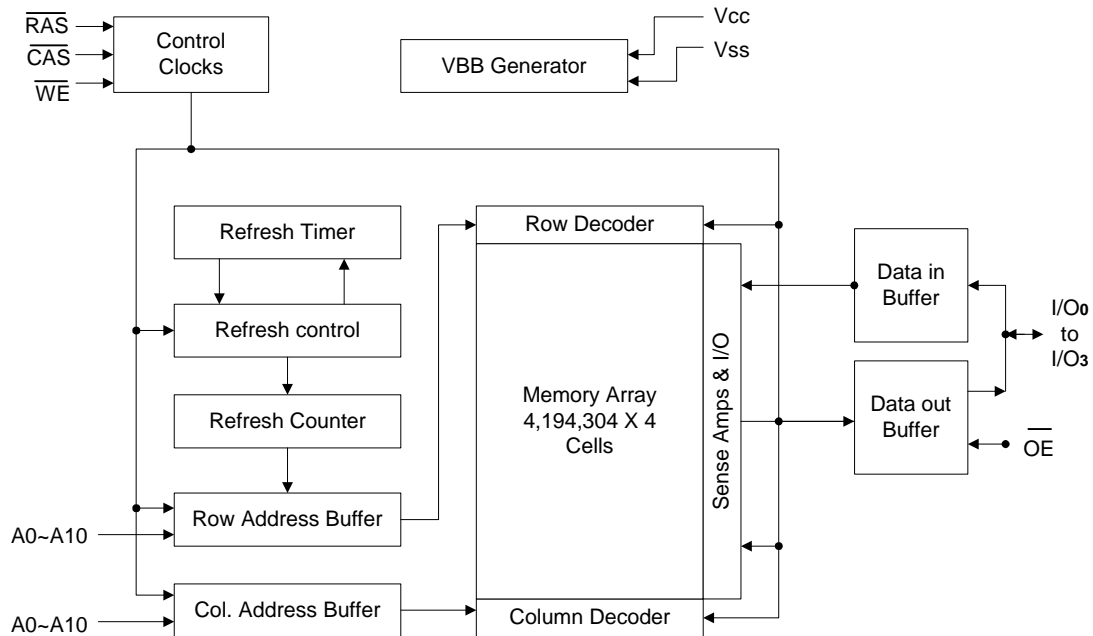

The A42U2604 offers an accelerated Fast Page Mode cycle through a feature called Extended Data Out, which keeps the output drivers on during the $\overline{\text{CAS}}$ precharge time (t_{cp}). Since data can be output after $\overline{\text{CAS}}$ goes high, the user is not required to wait for valid data to appear before starting the next access cycle. Data-out will remain

valid as long as $\overline{\text{RAS}}$ and $\overline{\text{OE}}$ are low, and $\overline{\text{WE}}$ is high; this is the only characteristic which differentiates Extended Data Out operation from a standard Read or Fast Page Read.

A memory cycle is terminated by returning both $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$ high. Memory cell data will retain its correct state by maintaining power and accessing all 2048(2K) combinations of the 11-bit(2K) row addresses, regardless of sequence, at least once every 32ms through any $\overline{\text{RAS}}$ cycle (Read, Write) or $\overline{\text{RAS}}$ Refresh cycle ($\overline{\text{RAS}}$ -only, CBR, or Hidden). The CBR Refresh cycle automatically controls the row addresses by invoking the refresh counter and controller.

Power-On

The initial application of the VCC supply requires a 200 μs wait followed by a minimum of any eight initialization cycles containing a $\overline{\text{RAS}}$ clock. During Power-On, the VCC current is dependent on the input levels of $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$. It is recommended that $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$ track with VCC or be held at a valid V_{ih} during Power-On to avoid current surges.

Absolute Maximum Ratings*

Input Voltage (Vin)	-0.5V to VCC+0.5V
Output Voltage (Vout)	-0.5V to VCC+0.5V
Power Supply Voltage (VCC)	-0.5V to VCC+0.5V
Operating Temperature (TOPR)	0°C to +70°C
Storage Temperature (TSTG)	-55°C to +150°C
Soldering Temperature X Time (TSOLDER)	260°C X 10sec
Power Dissipation (PD)	1W
Short Circuit Output Current (Iout)	50mA
Latch-up Current	200mA

***Comments**

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to this device. These are stress ratings only. Functional operation of this device at these or any other conditions above those indicated in the operational sections of these specification is not implied or intended. Exposure to the absolute maximum rating conditions for extended periods may affect device reliability.

Notes:

1. I_{CC1} , I_{CC3} , I_{CC4} , and I_{CC5} depend on cycle rate.
2. I_{CC1} and I_{CC4} depend on output loading. Specified values are obtained with the outputs open.
3. An initial pause of 200 μ s is required after power-up followed by any 8 \overline{RAS} cycles before proper device operation is achieved. In the case of an internal refresh counter, a minimum of 8 \overline{CAS} -before- \overline{RAS} initialization cycles instead of 8 \overline{RAS} cycles are required. 8 initialization cycles are required after extended periods of bias without.
4. AC Characteristics assume $t_r = 2$ ns. All AC parameters are measured with a load equivalent to one TTL load and 100pF, $V_{IL}(\text{min.}) \geq \text{GND}$ and $V_{IH}(\text{max.}) \leq V_{CC}$.
5. $V_{IH}(\text{min.})$ and $V_{IL}(\text{max.})$ are reference levels for measuring timing of input signals. Transition times are measured between V_{IH} and V_{IL} .
6. Operation within the $t_{rCD}(\text{max.})$ limit insures that $t_{rAC}(\text{max.})$ can be met. $t_{rCD}(\text{max.})$ is specified as a reference point only. If t_{rCD} is greater than the specified $t_{rCD}(\text{max.})$ limit, then access time is controlled exclusively by t_{cAC} .
7. Operation within the $t_{rAD}(\text{max.})$ limit insures that $t_{rAC}(\text{max.})$ can be met. $t_{rAD}(\text{max.})$ is specified as a reference point only. If t_{rAD} is greater than the specified $t_{rAD}(\text{max.})$ limit, then access time is controlled exclusively by t_{AA} .
8. Assumes three state test load (5pF and a 500 Ω Thevenin equivalent).
9. Either t_{rCH} or t_{rRH} must be satisfied for a read cycle.
10. $t_{OFF}(\text{max.})$ defines the time at which the output achieves the open circuit condition; it is not referenced to output voltage levels.
11. t_{wCS} , t_{wCH} , t_{rWD} , t_{cWD} and t_{AWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only. If $t_{wCS} \geq t_{wCS}(\text{min.})$ and $t_{wCH} \geq t_{wCH}(\text{min.})$, the cycle is an early write cycle and data-out pins will remain open circuit, high impedance, throughout the entire cycle. If $t_{rWD} \geq t_{rWD}(\text{min.})$, $t_{cWD} \geq t_{cWD}(\text{min.})$ and $t_{AWD} \geq t_{AWD}(\text{min.})$, the cycle is a read-modify-write cycle and the data out will contain data read from the selected cell. If neither of the above conditions is satisfied, the condition of the data out at access time is indeterminate.
12. Access time is determined by the longer of t_{AA} or t_{cAC} or t_{CPA} .
13. $t_{ASC} \geq t_{CP}$ to achieve $t_{PC}(\text{min.})$ and $t_{CPA}(\text{max.})$ values.

■ Self Refresh Mode.
a. Entering the Self Refresh Mode:

The A42U2604 Self Refresh Mode is entered by using \overline{CAS} before \overline{RAS} cycle and holding \overline{RAS} and \overline{CAS} signal "low" longer than 100 μ s.

b. Continuing the Self Refresh Mode:

The Self Refresh Mode is continued by holding \overline{RAS} "low" after entering the Self Refresh Mode.

It does not depend on \overline{CAS} being "high" or "low" after entering the Self Refresh Mode continue the Self Refresh Mode.

c. Exiting the Self Refresh Mode:

The A42U2604 exits the Self Refresh Mode when the \overline{RAS} signal is brought "high".
