

3.3 V 64K X 16 CMOS SRAM

Features

- Industrial and commercial versions
- Organization: 65,536 words × 16 bits
- Center power and ground pins for low noise
- High speed
 - 10/12/15/20 ns address access time
 - 5, 6, 7, 8 ns output enable access time
- Low power consumption: ACTIVE
 - 288 mW / max @ 10 ns
- Low power consumption: STANDBY
 - 18 mW / max CMOS I/O
- 6 T 0.18 u CMOS technology
- Easy memory expansion with \overline{CE} , \overline{OE} inputs
- TTL-compatible, three-state I/O
- JEDEC standard packaging
 - 44-pin 400 mil SOJ
 - 44-pin TSOP 2-400
- ESD protection ≥ 2000 volts
- Latch-up current ≥ 200 mA

Functional description

The AS7C31026B is a high-performance CMOS 1,048,576-bit Static Random Access Memory (SRAM) device organized as 65,536 words \times 16 bits. It is designed for memory applications where fast data access, low power, and simple interfacing are desired.

Equal address access and cycle times (t_{AA} , t_{RC} , t_{WC}) of 10/12/15/20 ns with output enable access times (t_{OE}) of 5, 6, 7, 8 ns are ideal for high-performance applications.

When \overline{CE} is high, the device enters standby mode. A write cycle is accomplished by asserting write enable (\overline{WE}) and chip enable (\overline{CE}). Data on the input pins I/O0 through I/O15 is written on the rising edge of \overline{WE} (write cycle 1) or \overline{CE} (write cycle 2). To avoid bus contention, external devices should drive I/O pins only after outputs have been disabled with output enable (\overline{OE}) or write enable (\overline{WE}).

A read cycle is accomplished by asserting output enable (\overline{OE}) and chip enable (\overline{CE}) with write enable (\overline{WE}) high. The chips drive I/O pins with the data word referenced by the input address. When either chip enable or output enable is inactive or write enable is active, output drivers stay in high-impedance mode.

The device provides multiple center power and ground pins, and separate byte enable controls, allowing individual bytes to be written and read. \overline{LB} controls the lower bits, I/O0 through I/O7, and \overline{UB} controls the higher bits, I/O8 through I/O15.

All chip inputs and outputs are TTL-compatible, and operation is from a single 3.3 V supply. The device is packaged in common industry standard packages.

Absolute maximum ratings

Parameter	Symbol	Min	Max	Unit
Voltage on V_{CC} relative to GND	V_{t1}	-0.50	+5.0	V
Voltage on any pin relative to GND	V_{t2}	-0.50	$V_{CC} + 0.50$	V
Power dissipation	P_D	-	1.0	W
Storage temperature (plastic)	T_{stg}	-65	+150	$^{\circ}C$
Ambient temperature with VCC applied	T_{bias}	-55	+125	$^{\circ}C$
DC current into outputs (low)	I_{OUT}	-	20	mA

Note: Stresses greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions outside those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Notes

- 1 During V_{CC} power-up, a pull-up resistor to V_{CC} on \overline{CE} is required to meet I_{SB} specification.
- 2 This parameter is sampled, but not 100% tested.
- 3 For test conditions, see *AC Test Conditions*, Figures A and B.
- 4 These parameters are specified with $C_L = 5$ pF, as in Figures B. Transition is measured ± 500 mV from steady-state voltage.
- 5 This parameter is guaranteed, but not tested.
- 6 \overline{WE} is high for read cycle.
- 7 \overline{CE} and \overline{OE} are low for read cycle.
- 8 Address is valid prior to or coincident with \overline{CE} transition low.
- 9 All read cycle timings are referenced from the last valid address to the first transitioning address.
- 10 N/A
- 11 All write cycle timings are referenced from the last valid address to the first transitioning address.
- 12 Not applicable.
- 13 $C = 30$ pF, except all high Z and low Z parameters where $C = 5$ pF.
