µP Supervisory Circuit

General Description

The ASM161 and ASM162 are cost effective, low power supervisory circuits that monitor power supplies in microprocessor, microcontroller and digital systems. If the power supply drops below the reset threshold level, a reset is asserted and remains asserted for atleast 800ms after V_{CC} has risen above the reset threshold. An improved manual reset architecture gives the system designer additional flexibility.

The debounced manual reset input is negative edge triggered. The reset pulse period generated by a \overline{MR} transition is a minimum of 800 ms and a maximum of 2 sec duration. In addition, The \overline{MR} input signal is blocked for an additional 49µS minimum after the reset pulse ends. During the \overline{MR} disable period, the microcontroller is guaranteed a time period free of additional manual reset signals. During this period DRAM contents can be refreshed or other critical system tasks undertaken. Low power consumption makes the ASM161/162 ideal for use in portable and battery operated equipments. With 3V supplies power consumption is 8µW typically and 30µW maximum. The ASM161 has an open-drain, active-LOW \overline{RESET} output and requires an external pull-up resistor. The ASM162 has an active HIGH RESET output.

The ASM161/162 are offered in compact 4-pin SOT-143 packages. No external components are required to trim threshold voltage for monitoring different supply voltages. With six different factory set, reset, threshold ranges from 2.63V to 4.63V, the ASM161/162 are suitable for monitoring 5V, 3.6V and 3.0V supplies. The ASM161/162 are available in temperature ranges 0⁰ to 70⁰c and -40⁰c to +85⁰c.

Reset Threshold	
Part Suffix	Voltage (V)
L	4.63
M	4.38
J	4.00
T	3.08
S	2.93
R	2.63

Key Features

- Edge triggered manual reset input
- single pulse output
- 49µS minimum \overline{MR} disable period after reset
- CMOS/TTL logic or switch interface
- Debounced input
- Low supply current extends battery life
 - 6µA / 15µA typ/max at 5.5V
 - 4.5µA / 10µA typ/max at 3.6V
- Long reset period
 - 0.8 sec minimum, 2 sec maximum
- Two reset polarity options
 - ASM161: Active LOW, open-drain
 - ASM162: Active HIGH
- Pinout matches the AS811/812
- Small 4-Pin SOT-143 package
- Two temperature ranges: 0⁰ to 70⁰c and -40⁰c to +85⁰c

Applications

- PDAs
- Appliances
- Computers and embedded controllers
- Wireless communication systems
- Battery operated and intelligent instruments
- Automotive systems
- Safety systems

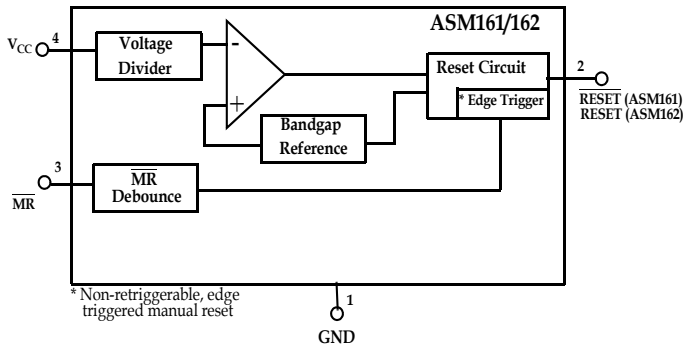

Typical Operating Circuit

Block Diagram

Pin Configuration

$\overline{\text{RESET}}$ is open drain

Pin Description

Pin #		Pin Name	Description
ASM161	ASM162		
1	1	GND	Ground.
2	-	$\overline{\text{RESET}}$	Active-LOW, open-drain reset output. $\overline{\text{RESET}}$ remains LOW while V_{CC} is below the reset threshold and for 800ms minimum after V_{CC} rises above the reset threshold. An external pull-up resistor is needed.
-	2	RESET	Active HIGH reset output. RESET remains HIGH while V_{CC} is below the reset threshold and for 800ms after V_{CC} rises above the reset threshold.
3	3	$\overline{\text{MR}}$	Manual reset input. A negative going edge transition on $\overline{\text{MR}}$ asserts reset. Reset remains asserted for one reset time-out period (800 ms min). This active-LOW input has an internal pull-up resistor. It can be driven from a TTL or CMOS logic line or shorted to ground with a switch. Leave open if unused.
4	4	V_{CC}	Power supply input voltage.

rev 1.0

Detailed Descriptions

The reset function ensures the microprocessor is properly reset and powers up into a known condition after a power failure.

Reset Timing

A reset is generated whenever the supply voltage is below the threshold level ($V_{CC} < V_{TH}$). The reset duration is at least 800ms after V_{CC} has risen above the reset threshold and is guaranteed to be no more than 2 seconds. The rest signal remains active as long as the monitored supply voltage is below the internal threshold voltage.

The ASM161 has an open-drain, active LOW \overline{RESET} output (which is guaranteed to be in the correct state for V_{CC} down to 1.1 V). The ASM161 uses an external pull-up resistor. Output leakage current is under 1 μ A. A high resistance value can be used to minimize current drain.

The ASM162 generates an active-HIGH RESET output.

Part Number	Reset Polarity
ASM161	LOW (use external pull-up resistor)
ASM162	HIGH

Manual Reset

The ASM161/162 have a unique manual reset circuit. A negative going edge transition on \overline{MR} initiates the reset. A manual reset generates a single reset pulse of fixed length. The output-reset pulse remains asserted for the Reset Active Time-Out Period t_{RP} and then clears. Once the reset pulse is completed, the \overline{MR} input remains disabled for at least 49 μ S but not more than 122 μ S. This period is specified as t_{MRD} .

During the \overline{MR} disabled period, the microcontroller is guaranteed a time period free of new manual reset signals. This period can be used to refresh critical DRAM contents or other system tasks.

The \overline{MR} pin must be taken HIGH and LOW again after the t_{MRD} period has been completed to initiate another reset pulse.

The manual reset input has an internal 20k Ω pull-up resistor. \overline{MR} can be left open if not used.

*Second and following edges ignored
Figure 1: Manual Reset Timing

Application Information

Glitch Resistance

The ASM161/162 are relatively immune to short duration negative-going V_{CC} transients/glitches. A V_{CC} transient that goes 100mV below the reset threshold and lasts 20s or less will not typically cause a reset pulse.

Figure 2: RESET valid with VCC under 1.1V

Valid Reset with VCC under 1.1V

To ensure that logic inputs connected to the ASM162 RESET pin are in a known state when V_{CC} is under 1.1V, a 100k Ω pull-down resistor at RESET is needed. The value is not critical.

This scheme does not work with the open-drain outputs of ASM161.

Electrical Characteristics

Unless otherwise noted, V_{CC} is over the full range and $T_A = 0^{\circ}$ to 70° C for ASM161/162 X C and $T_A = -40^{\circ}$ C to $+85^{\circ}$ C for ASM161/162 X E devices. Typical values at $T_A = 25^{\circ}$ C, $V_{CC} = 5V$ for L/M/J devices, $V_{CC} = 3.3V$ for T/S devices and $V_{CC} = 3V$ for R devices

Parameter	Symbol	Conditions		Min	Typ	Max	Unit
Input Voltage (V_{CC}) Range	V_{CC}	$T_A = 0^{\circ}$ C to 70° C		1.1		5.5	V
Supply Current (Unloaded)	I_{CC}	$T_A = 0^{\circ}$ C to 70° C, $T_A = -40^{\circ}$ C to $+85^{\circ}$ C	$V_{CC} < 5.5V$, L/M/J		6	15	μ A
		$T_A = 0^{\circ}$ C to 70° C, $T_A = -40^{\circ}$ C to $+85^{\circ}$ C	$V_{CC} < 3.6V$, R/S/T		4.5	10
