

## 12-24GHz Frequency Multiplier

### GaAs Monolithic Microwave IC in SMD leadless package

#### Description

The monolithic microwave IC (MMIC) in the package is a cascaded by 2 frequency multiplier. It is designed for a wide range of applications, from military to commercial communication systems. The circuit is manufactured with a PM-HEMT process, 0.25 $\mu$ m gate length, via holes through the substrate, air bridges and electron beam gate lithography.

It is supplied in a new SMT leadless chip carrier.

#### Main Features

- Broadband performances : 11-13GHz ( $f_0$ )
- Output power 13dBm (at  $2f_0$ ) for  $P_{in} = 12$ dBm (at  $f_0$ )
- Rejection better than 15dBc (related to  $P_{out}$  at  $2f_0$ )
- SMT leadless package
- Dimensions: 5.08 x 5.08 x 0.97 mm<sup>3</sup>

#### SMT Package Dimensions

PIN	Function	PIN	Function
1	NC	5	Vd
2	NC	6	Vg2
3	NC	7	Vg1
4	RF out	8	RF in

Please note that PIN 1 is located in the lower left corner of the package (front-side view) for all SMD-type packages from United Monolithic Semiconductors. It is indicated by a triangle on the package lid. Starting with PIN 1 the other pads are numbered counter-clockwise (front-side view). ATTENTION: The dot on the backside of the package (i.e. side with metallic pads) is just for fabrication purposes and does NOT indicate the location of PIN 1.

## Schematic

## Typical Bias Conditions

for an ambient Temperature of +25°C

Symbol	Pin No.	Parameter	Values	Unit
Vd	5	Drain bias voltage	3.5	V
Vg2	6	Gate bias voltage (2nd stage)	-0.4	V
Vg1	7	Gate bias voltage (1st stage)	-0.9	V
Id2	5	Drain current (2nd stage)	26	mA
Id1	5	Drain current (1st stage)	14	mA

All other pins are not used for this device.

## Absolute Maximum Ratings

Tamb. = 25°C (1)

Symbol	Parameter	Values	Unit
Vd	Drain bias voltage	5V	V
Id	Drain bias current	120	mA
Vg	Gate bias voltage	-2 to +0.4	V
Ta	Operating temperature range (2)	-40 to +85	°C
Tstg	Storage temperature range	-55 to +155	°C

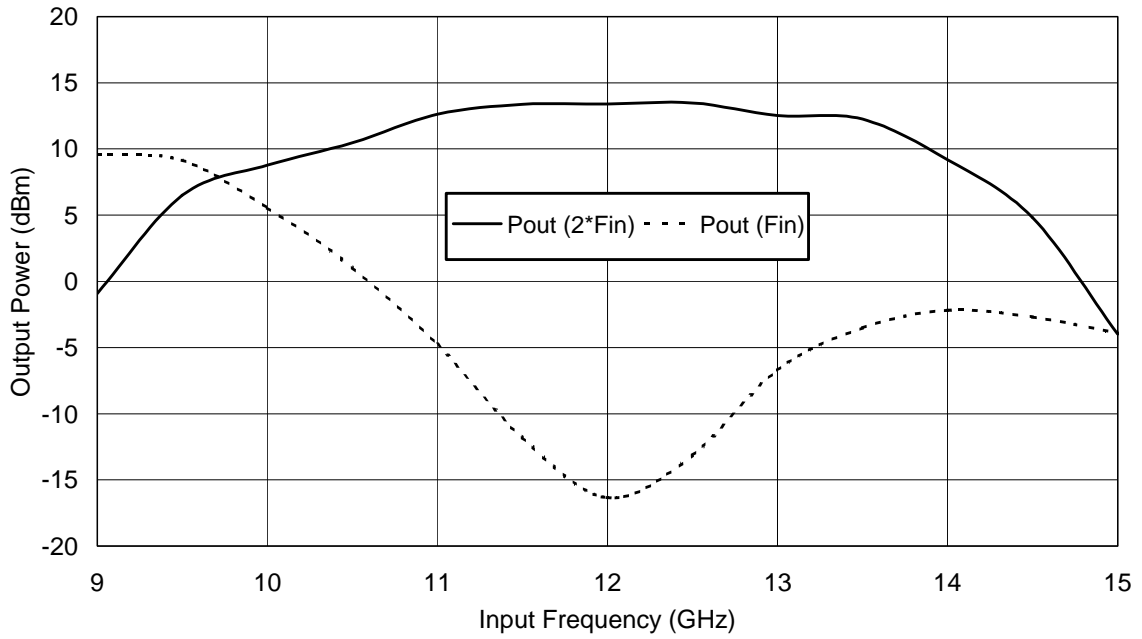

- (1) Operation of this device above anyone of these parameters may cause permanent damage.
- (2) Upper temperature limit strongly dependent on motherboard design; ratings given for ideal thermal coupling

**Typical results on PCB (recommended motherboard layout)**

Bias conditions:  $V_d = 3.5\text{ V}$  ,  $V_{g1} = -0.9\text{ V}$  ,  $V_{g2} = -0.4\text{ V}$

*Preliminary*

$P_{out} = f(Fin)$  for  $P_{in} = 12\text{ dBm}$

**Footprint**

**Application note***Preliminary*

The design of the motherboard has a strong impact on the over all performance since the transition from the motherboard to the package is comparably large. In case of the SMD type packages of United Monolithic Semiconductors the motherboard should be designed according to the information given in the following to achieve good performance. Other configurations are also possible but can lead to different results. If you need advise please contact United Monolithic Semiconductors for further information.

SMD type packages of UMS should allow design and fabrication of micro- and mm-wave modules at low cost. Therefore, a suitable motherboard environment has been chosen. All tests and verifications have been performed on Rogers RO4003. This material exhibits a permittivity of 3.38 and has been used with a thickness of 200 $\mu$ m [8 mils] and a 1/2oz or less copper cladding. The corresponding 50 Ohm transmission line has a strip width of about 460 $\mu$ m [approx. 18 mils].

The contact areas on the motherboard for the package connections should be designed according to the footprint given above. The proper via structure under the ground pad is very important in order to achieve a good RF and lifetime performance. All tests have been done by using a grid of plenty plated through vias with a diameter of less than 200 $\mu$ m [8 mils] and a spacing of less than 400 $\mu$ m [16 mils] from the centres of two adjacent vias. The via grid should cover the whole space under the ground pad and the vias closest to the RF ports should be located near the edge of the pad to allow a good RF ground connection. Since the vias are important for heat transfer, a proper via filling should be guaranteed during the mounting procedure to get a low thermal resistance between package and heat sink. For power devices the use of heat slugs in the motherboard instead of a via grid is recommended.

For the mounting process the SMD type package can be handled as a standard surface mount component. The use of either solder or conductive epoxy is possible. The solder thickness after reflow should be typical 50 $\mu$ m [2 mils] and the lateral alignment between the package and the motherboard should be within 50 $\mu$ m [2 mils]. Caution should be taken to obtain a good and reliable contact over the whole pad areas. Voids or other improper connections, in particular, between the ground pads of motherboard and package will lead to a deterioration of the RF performance and the heat dissipation. The latter effect can reduce drastically reliability and lifetime of the product.

*Preliminary*

The RF ports comprise a DC blocking capacitor on chip level. The DC connections include a first level of DC decoupling capacitors (typically 120pF) in the package. However, all DC bias ports should be additionally connected to ground with 10nF capacitors at board level to prevent the MMIC from oscillations. These parts should be placed close to the SMD leadless package. If the same bias is required at different DC ports, the lines should only be connected behind these block capacitors.

Further information on the application of the SMD leadless packages for GaAs monolithic microwave ICs are given in the UMS Application Note AN0005.

## Ordering Information

SMT leadless package form : CHX2090RBF/24
