

2ch. Read/Write Amplifier for Thin Film Head of Hard Disk Drive

Description

The CXA3188N is a Read/Write Amplifier for the thin film head of hard disk drive and designed to handle up to 2 channel heads.

Features

- Operate on single +5 V power supply
- Low power consumption
 - Read : 90 mW
 - Write : 115 mW + $I_w \times 5$
 - Idle : 8 mW
- Designed for two terminal thin-film or MIG heads.
- Read amplifier emitter follower output featuring 200 times gain(typ).
- Differential input capacitance for Read : 6pF (typ)
- Input noise : $0.47 \text{ nV} / \sqrt{\text{Hz}}$ (typ)
- Write current range : 10 to 20 mA
- Differential Head voltage swing : 9 Vp-p (typ)
- Differential P-ECL write data input.
- Built-in write unsafe detection circuit.
- Built-in Servo write function.
- Read data outputs are high impedance in write mode.
- Unselected head voltage is high impedance.
- Self switching damping resistor 380Ω .
- Built-in supply voltage monitor circuit prohibits incorrect write during power on or abnormal voltage.

Function

Read, Write and Write unsafe detection for HDD, power supply ON/OFF detection.

Structure

Bipolar silicon monolithic IC

16 pin SSOP (Plastic)

Absolute Maximum Ratings (Ta=25 °C)

• Supply voltage	V _{CC}	6	V
• Operating temperature	T _{opr}	-20 to +70	°C
• Storage temperature	T _{stg}	-55 to +150	°C
• Allowable power dissipation (on board)	P _D	760	mW
• Write current	I _w	22	mA
• WUS/SE pin input current	I _{SEH}	15	mA

Operating Conditions

Supply voltage	V _{CC}	5±0.5	V
----------------	-----------------	-------	---

Block Diagram and Pin Configuration

Pin Description

No.	Symbol	Equivalent circuit	Description
1	GND		
2 3 4 5	H0X H0Y H1X H1Y		Head. 2 channels provided.
6	Vcc		5 V power supply.
7	NC		
8	WUS/SE		Write unsafe detection output / Servo Enable signal input.
9 10	WDY WDX		Differential P-ECL write data input.

No.	Symbol	Equivalent circuit	Description

Description of Functions

Read amplifier

This is a low noise amplifier for amplifying the signals from the heads with an emitter follower output.

The RDX and RDY are the outputs of the differential amplifier, the X side of the head input and RDX pin and the Y side of the head inputs and RDY pin have the same polarity.

Write circuit

The Write data input to WDX pin and WDY pin passes through the buffer amp. It drives the Write switch circuit which supplies the Write current to the heads.

The Write current flows into the X side when WDX is "Low" and WDY is "High".

Mode control

The mode are set as shown Table 1 by $\overline{R/W}$ and WUS/SE.

\overline{CS}	$\overline{R/W}$	WUS/SE	Mode
L	L	X	Write
L	H	X	Read
L	L	**	Servo Write
H	X	X	Power Save

Table 1. Mode selection

Servo write mode **

This mode allows for writing to multiple channels at once. In this mode the write driver will drive all channels simultaneously.

To enable servo write mode follow these steps:

- (1) Place the device in the Read mode.
- (2) Set WUS/SE to V_{SEH} volts, or input I_{SEH} to WUS/SE.
- (3) Initiate the write operation by setting $\overline{R/W}$ Low.

Write unsafe detection circuit

This circuit detects write errors.

In normal Write mode, the WUS output is low; in the conditions listed below, it is high.

- Head input is open (under the condition which $R_H = \infty$ and Write data frequency is ≤ 10 MHz)
- Head input is shorted to GND or V_{CC} .
- Write data frequency is abnormally low.
- No Write current.
- In read mode.
- Supply voltage is abnormal (see "power supply ON/OFF detection").

Power supply ON/OFF detection

This circuit monitors V_{CC} to detect erroneous Writes. The error status is established when V_{CC} falls below the threshold voltage (V_{TH}) of the power supply ON/OFF detector, in which case the recording and playback functions are prohibited. When V_{CC} rises above, V_{TH} , the prohibition of these functions is released.

Application Circuit

Application circuits shown are typical examples illustrating the operation of the devices. Sony cannot assume responsibility for any problems arising out of the use of these circuits or for any infringement of third party patent and other right due to same.

Notes on operation

- This device handles high frequency and high gain signals. Please note the following;
 - ◆ Connect V_{CC} decoupling capacitor of approximately 1000 pF near the device.
 - ◆ Make the GND area as large as possible.
- The WC pin is a constant voltage pin. When noise affects this pin, it creates noise in Write current. Therefore, locate R_{wc} as close to the device as possible.
- Write unsafe detection circuit
This circuit uses the voltage waveforms of the head pins for detection.

- ◆ V_{FB} must be more than 2 V. When $V_{FB} < 2 V$, it is possible that Write unsafe detection maximum frequency becomes more than 1 MHz.
- ◆ The normal operating area of write unsafe detection circuit is changed by head inductance, head DC resistance, write current and other.

Application Notes

Use the following characteristics for reference

V_{CC}=5 V, T_a=25 °C

Item		Symbol	Condition	Min.	Typ.	Max.	Unit
Write mode	Differential output capacitance	C _O	Between head input pins		4.5	6	pF
	Differential output resistance	R _D		250	380	490	Ω
Read mode	Differential input capacitance	C _I	Between head input pins f=5MHz		6	10	pF
	Differential input resistance	R _I		0.4	1.2		kΩ
	Output resistance	R _{RD}	RDX or RDY, f=5MHz		45	60	Ω
Unselected head differential current at write mode		I _{US}	L _H =2 μH, R _H =30 Ω I _W =15 mA			0.2	mAp-p
Write current symmetry		T _{ASY}	L _H =0 μH, R _H =0 Ω I _W =15 mA	-0.5		0.5	ns

*T_{AS}=T₁-T₂

Setting of Write current

Write current can be set with resistor R_{wc} (kΩ) at Pin 14.

I_w=K/R_{wc} (mA) Refer to Fig. 5.
