

Dual Ultra Low Noise Amplifier

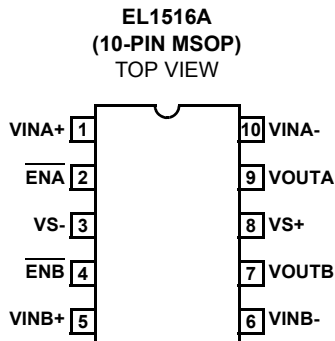

The EL1516 is a dual, ultra low noise amplifier, ideally suited to line receiving applications in ADSL, VDSL, and home PNA designs. With low noise specification of just $1.3\text{nV}/\sqrt{\text{Hz}}$ and $1.5\text{pA}/\sqrt{\text{Hz}}$, the EL1516 is perfect for the detection of very low amplitude signals.

The EL1516 features a -3dB bandwidth of 350MHz @ $A_V = -1$ and is gain-of-2 stable. The EL1516 also affords minimal power dissipation with a supply current of just 5.5mA per amplifier. The amplifier can be powered from supplies ranging from 5V to 12V.

The EL1516A incorporates an enable and disable function to reduce the supply current to 5nA typical per amplifier, allowing the $\overline{\text{EN}}$ pins to float or apply a low logic level will enable the amplifiers.

The EL1516 is available in space-saving 8-pin MSOP and industry-standard 8-pin SO packages and the EL1516A is available in a 10-pin MSOP package. All are specified for operation over the -40°C to $+85^\circ\text{C}$ temperature range.

Pinouts

Features

- EL2227 upgrade replacement
- Voltage noise of only $1.3\text{nV}/\sqrt{\text{Hz}}$
- Current noise of only $1.5\text{pA}/\sqrt{\text{Hz}}$
- Bandwidth (-3dB) of 350MHz @ $A_V = -1$
- Bandwidth (-3dB) of 250MHz @ $A_V = +2$
- Gain-of-2 stable
- Just 5.5mA per amplifier
- $100\text{mA } I_{\text{OUT}}$
- Fast enable/disable (EL1516A only)
- 5V to 12V operation
- Pb-free available (RoHS compliant)

Applications

- ADSL receivers
- VDSL receivers
- Home PNA receivers
- Ultrasound input amplifiers
- Wideband instrumentation
- Communications equipment
- AGC & PLL active filters
- Wideband sensors

Applications Information

Product Description

The EL1516 is a dual voltage feedback operational amplifier designed especially for DMT ADSL and other applications requiring very low voltage and current noise. It also features low distortion while drawing moderately low supply current. The EL1516 uses a classical voltage-feedback topology which allows it to be used in a variety of applications where current-feedback amplifiers are not appropriate because of restrictions placed upon the feedback element used with the amplifier. The conventional topology of the EL1516 allows, for example, a capacitor to be placed in the feedback path, making it an excellent choice for applications such as active filters, sample-and-holds, or integrators.

ADSL CPE Applications

The low noise EL1516 amplifier is specifically designed for the dual differential receiver amplifier function with ADSL transceiver hybrids as well as other low-noise amplifier applications. A typical ADSL CPE line interface circuit is shown in Figure 44. The EL1516 is used in receiving DMT down stream signal. With careful transceiver hybrid design and the EL1516 1.4nV/√Hz voltage noise and 1.5pA/√Hz current noise performance, -140dBm/Hz system background noise performance can be easily achieved.

FIGURE 44. TYPICAL LINE INTERFACE CONNECTION

Power Dissipation

With the wide power supply range and large output drive capability of the EL1516, it is possible to exceed the 150°C maximum junction temperatures under certain load and power supply conditions. It is therefore important to calculate the maximum junction temperature (T_{JMAX}) for all applications to determine if power supply voltages, load conditions, or package type need to be modified for the

EL1516 to remain in the safe operating area. These parameters are related as follows:

$$T_{JMAX} = T_{MAX} + (\theta_{JA} \times PD_{MAXTOTAL})$$

where:

- $PD_{MAXTOTAL}$ is the sum of the maximum power dissipation of each amplifier in the package (PD_{MAX})
- PD_{MAX} for each amplifier can be calculated as follows:

$$PD_{MAX} = 2 \times V_S \times I_{SMAX} + (V_S - V_{OUTMAX}) \times \frac{V_{OUTMAX}}{R_L}$$

where:

- T_{MAX} = Maximum ambient temperature
- θ_{JA} = Thermal resistance of the package
- PD_{MAX} = Maximum power dissipation of 1 amplifier
- V_S = Supply voltage
- I_{MAX} = Maximum supply current of 1 amplifier
- V_{OUTMAX} = Maximum output voltage swing of the application
- R_L = Load resistance

To serve as a guide for the user, we can calculate maximum allowable supply voltages for the example of the video cable-driver below since we know that $T_{JMAX} = 150^\circ\text{C}$, $T_{MAX} = 75^\circ\text{C}$, $I_{SMAX} = 7.7\text{mA}$, and the package θ_{JA} s are shown in Table 1. If we assume (for this example) that we are driving a back-terminated video cable, then the maximum average value (over duty-cycle) of V_{OUTMAX} is 1.4V, and $R_L = 150\Omega$, giving the results seen in Table 1.

TABLE 1.

PART	PACKAGE	θ_{JA}	MAX PD DISS @ T_{MAX}	MAX V_S
EL1516IS	SO8	110°C/W	0.406W @ 85°C	
EL1516IY	MSOP8	115°C/W	0.400W @ 85°C	
EL1516AIY	MSOP10	115°C/W	0.400W @ 85°C	

Single-Supply Operation

The EL1516 has been designed to have a wide input and output voltage range. This design also makes the EL1516 an excellent choice for single-supply operation. Using a single positive supply, the lower input voltage range is within 1.2V of ground ($R_L = 500\Omega$), and the lower output voltage range is within 875mV of ground. Upper input voltage range reaches 3.6V, and output voltage range reaches 3.8V with a 5V supply and $R_L = 500\Omega$. This results in a 2.625V output swing on a single 5V supply. This wide output voltage range also

EL1516, EL1516A

allows single-supply operation with a supply voltage as high as 12V.

Gain-Bandwidth Product and the -3dB Bandwidth

The EL1516 has a gain-bandwidth product of 300MHz while using only 6mA of supply current per amplifier. For gains greater than 2, their closed-loop -3dB bandwidth is approximately equal to the gain-bandwidth product divided by the noise gain of the circuit. For gains less than 2, higher-order poles in the amplifiers' transfer function contribute to even higher closed loop bandwidths. For example, the EL1516 has a -3dB bandwidth of 350MHz at a gain of +2, dropping to 80MHz at a gain of +5. It is important to note that the EL1516 has been designed so that this "extra" bandwidth in low-gain applications does not come at the expense of stability. As seen in the typical performance curves, the EL1516 in a gain of +2 only exhibits 0.5dB of peaking with a 1000Ω load.

Output Drive Capability

The EL1516 has been designed to drive low impedance loads. It can easily drive 6V_{pp} into a 100Ω load. This high

output drive capability makes the EL1516 an ideal choice for RF, IF and video applications.

Printed-Circuit Layout

The EL1516 is well behaved, and easy to apply in most applications. However, a few simple techniques will help assure rapid, high quality results. As with any high-frequency device, good PCB layout is necessary for optimum performance. Ground-plane construction is highly recommended, as is good power supply bypassing. A 0.1μF ceramic capacitor is recommended for bypassing both supplies. Lead lengths should be as short as possible, and bypass capacitors should be as close to the device pins as possible. For good AC performance, parasitic capacitances should be kept to a minimum at both inputs and at the output. Resistor values should be kept under 5kΩ because of the RC time constants associated with the parasitic capacitance. Metal-film and carbon resistors are both acceptable, use of wire-wound resistors is not recommended because of their parasitic inductance. Similarly, capacitors should be low-inductance for best performance.
