

## Preliminary

### GENERAL DESCRIPTION

EM73A89B is an advanced single chip CMOS 4-bit micro-controller. It contains 16K-byte ROM, 1012-nibble RAM, 4-bit ALU, 13-level subroutine nesting, 22-stage time base, two 12-bit timer/counters for the kernel function, and one high speed counter. EM73A89B also equipped with 6 interrupt sources, 3~7 I/O ports (including 1 input port and 2~7 bidirection ports), LCD display (64x16 or 64x32), built-in watch-dog-timer and speech synthesizer.

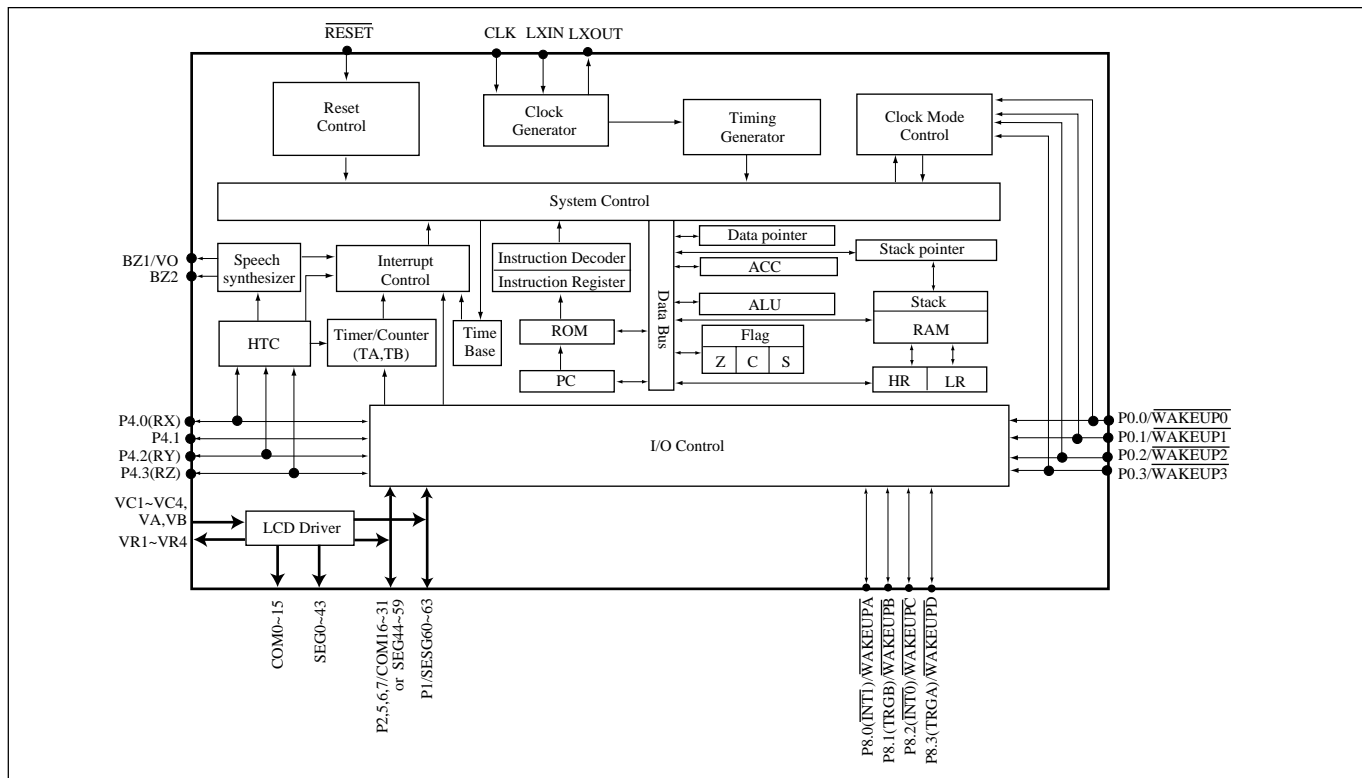

Its low power consumption and high speed feature are further strengthened with DUAL, SLOW, IDLE and STOP operation mode for optimized power saving.

### FEATURES

- Operation voltage : 2.2V to 3.6V.
- Clock source : Dual clock system. Low-frequency oscillator is 32KHz. Crystal oscillator or RC oscillator by mask option and high-frequency oscillator is a built-in internal oscillator.
- Instruction set : 107 powerful instructions.
- Instruction cycle time : 0.85 $\mu$ s for 9.2M or 1.7 $\mu$ s for 4.6M Hz selected by mask option (high speed clock). 122 $\mu$ s for 32768 Hz (low speed clock, frequency double).
- ROM capacity : 16K x 8 bits.
- RAM capacity : 1012 x 4 bits.
- Input port : 1 port (P0.0-P0.3), IDLE/STOP releasing function is available by mask option. (each input pin has a pull-up and pull-down resistor available by mask option).
- Bidirection port : 2~7 ports (P1, P2, P4, P5, P6, P7, P8). IDLE/STOP release function for P8(0..3) is available by mask option. P1, P2, P5, P6, P7 are shared with LCD pins.
- Built-in watch-dog-timer counter : It is available by mask option.
- 12-bit timer/counter : Two 12-bit timer/counters are programmable for timer, event counter and pulse width measurement mode.
- Built-in time base counter : 22 stages.
- Subroutine nesting : Up to 13 levels.
- Interrupt : External interrupt . . . . . 2 input interrupt sources.  
Internal interrupt . . . . . 2 timer overflow interrupts, 1 time base interrupt.  
1 speech/HTC interrupt.
- High speed counter : The high speed counter includes one 8-bit high speed counter and a resistor to frequency oscillator. It has resistor to frequency oscillation mode, melody mode and auto load timer mode.
- LCD driver : 64x32 or 64x16 dots, 1/32 or 1/16 duty, 1/5 bias by mask option.
- Speech synthesizer : 992K speech data ROM (use as 992K nibbles data ROM).
- PWM or current D/A : Output selection by mask option.
- Power saving function : SLOW, IDLE, STOP operation modes.
- Package type : Chip form 126 pins.

**FUNCTION BLOCK DIAGRAM**

*Preliminary*

**PIN DESCRIPTIONS**

Symbol	Pin-type	Function
$V_{DD}, V_{DD2}$		Power supply (+)
$V_{SS}$		Power supply (-)
$\overline{RESET}$	RESET-A	System reset input signal, low active mask option : none pull-up
CLK	OSC-G	Capacitor connecting pin for internal high frequency oscillator.
LXIN	OSC-B/OSC-H	Crystal/Resistor connecting pin for low speed clock source.
LXOUT	OSC-B	Crystal connecting pin for low speed clock source.
P0(0..3)/WAKEUP0..3	INPUT-B	4-bit input port with IDLE/STOP releasing function mask option : wakeup enable, pull-up wakeup enable, none wakeup disable, pull-up wakeup disable, pull-down wakeup disable, none
P4.0(RX), P4.2(RY), P4.3(RZ)	I/O-X1	3-bit bidirection I/O pins or RF oscillation input pins. mask option : open-drain (apply to RF oscillation) high current push-pull normal current push-pull low current push-pull
P4.1	I/O-Q1	1-bit bidirection I/O pin. mask option : open-drain high current push-pull normal current push-pull low current push-pull

\* This specification are subject to be changed without notice.

## Preliminary

Symbol	Pin-type	Function
P8.0(INT1)/WAKEUPA P8.2(INT0)/WAKEUPC	I/O-X1	2-bit bidirection I/O port with external interrupt sources input and IDLE /STOP releasing function mask option :      wakeup enable, normal current push-pull wakeup enable, low current push-pull wakeup disable, high current push-pull wakeup disable, normal current push-pull wakeup disable, low current push-pull wakeup disable, open drain
P8.1(TRGB)/WAKEUPB P8.3(TRGA)/WAKEUPD	I/O-X1	2-bit bidirection I/O port with time/counter A,B external input and IDLE /STOP releasing function mask option :      wakeup enable, normal current push-pull wakeup enable, low current push-pull wakeup disable, high current push-pull wakeup disable, normal current push-pull wakeup disable, low current push-pull wakeup disable, open drain
VCA, VCB, V1~V6		LCD bias voltage pins
BZ1/VO		PWM or current D/A output pin for speech synthesizer by mask option
BZ2		PWM output pin for speech synthesizer
TEST		Tie Vss as package type, no connecting as COB type.

**\*16 COMMONS :**

COM0~COM15		LCD common output pins
SEG0~SEG59		LCD segment output pins
P1(0..3)/SEG63..60	I/O-P	4-bit bidirection I/O pins with LCD segment pins mask option :      LCD segment pin push-pull open-drain
P2(0..3),P5(0..3), P6(0..3),P7(0..3)	I/O-P	16-bit bidirection I/O pins mask option :      push-pull open-drain

**\*32 COMMONS :**

*Preliminary*

**FUNCTION DESCRIPTIONS**

**PROGRAM ROM ( 16K X 8 bits )**

16 K x 8 bits program ROM contains user's program and some fixed data.

The basic structure of the program ROM may be categorized into 5 partitions.

1. Address 0000h : Reset start address.
2. Address 0002h - 000Ch : 6 kinds of interrupt service routine entry addresses.
3. Address 000Eh - 0086h : SCALL subroutine entry address, only available at 000Eh, 0016h, 001Eh, 0026h, 002Eh, 0036h, 003Eh, 0046h, 004Eh, 0056h, 005Eh, 0066h, 006Eh, 0076h, 007Eh, 0086h.
4. Address 0000h - 07FFh : LCALL subroutine entry address.
5. Address 0000h - 1FFFh : Except used as above function, the other region can be used as user's program and data region.

address      Bank 0 :

## Preliminary

User's program and fixed data are stored in the program ROM. User's program is executed using the PC value to fetch an instruction code.

The 16Kx8 bits program ROM can be divided into 4 banks. There are 4Kx8 bits per bank.

The program ROM bank is selected by P3(1..0). The program counter is a 13-bit binary counter. The PC and P3 are initialized to "0" during reset.

When P3(1..0)=00B or 11B, the bank0 and bank1 of program ROM will be selected. P3(1..0)=01B, the bank0 and bank2 will be selected. P3(1..0)=10B, the bank0 and bank3 will be selected.

Address	P3=xx00B P3=xx11B	P3=xx01B	P3=xx10B
0000h	Bank0	Bank0	Bank0
:			
:			
0FFFh	Bank1	Bank2	Bank3

      BANK 1
XA1 :   :
        :
        B    XA
        :
XA2 :   :
    
```

**Preliminary**

```

        B      XA2
        :
;-----
XB1 :      BANK 2
        :
        :
        B      XB
        :
XB2 :      :
        :
        B      XB2
        :
;-----
XC1 :      BANK 3
        :
        :
        B      XC
        :
XC2 :      :
        :
        B      XC2
    
```

Fixed data can be read out by table-look-up instruction. Table-look-up instruction is requires the Data point (DP) to indicate the ROM address in obtaining the ROM code data (Except bank 0) :

```

LDAX      Acc ← ROM[DP]L
LDAXI     Acc ← ROM[DP]H,DP+1
    
```

DP is a 12-bit data register that stores the program ROM address as pointer for the ROM code data. User has to initially load ROM address into DP with instructions "STADPL", and "STADPM, STADPH", then to obtain the lower nibble of ROM code data by instruction "LDAX" and higher nibble by instruction "LDAXI".

PROGRAM EXAMPLE: Read out the ROM code of address 1777h by table-look-up instruction.

```

LDIA      #07h;
STADPL           ; [DP]L ← 07h
STADPM          ; [DP]M ← 07h
STADPH          ; [DP]H ← 07h, Load DP=777h
:
LDL         #00h;
LDH         #03h;
LDAX                ; ACC ← 6h
STAMI                ; RAM[30] ← 6h
LDAXI                ; ACC ← 5h
STAM                ; RAM[31] ← 5h
:
ORG         1777h
DATA        56h;
    
```

#### DATA RAM ( 1012-nibble )

A total 1012 - nibble data RAM is available from address 000 to 3FFh  
Data RAM includes the zero page region, stacks and data areas.

\* This specification are subject to be changed without notice.

## Preliminary

### ZERO- PAGE:

From 000h to 00Fh is the zero-page location. It is used as the zero-page address mode pointer for the instruction of "STD #k,y; ADD #k,y; CLR y,b; CMP k,y".

PROGRAM EXAMPLE: To write immediate data "07h" to RAM [03] and to clear bit 2 of RAM [0Eh].

```
STD #07h, 03h ; RAM[03] ← 07h
CLR 0Eh,2 ; RAM[0Eh]2 ← 0
```

### STACK:

There are 13 - level (maximum) stack levels that user can use for subroutine (including interrupt and CALL). User can assign any level be the starting stack by providing the level number to stack pointer (SP).

When an instruction (CALL or interrupt) is invoked, before enter the subroutine, the previous PC address is saved into the stack until returned from those subroutines, the PC value is restored by the data saved in stack.

### DATA AREA:

Except the area used by user's application, the whole RAM can be used as data area for storing and loading general data.

### ADDRESSING MODE

The 1012 nibble data memory consists of four banks (bank 0 ~ bank 3). There are 244x4 bits (address 000h~0F3h) in bank 0 and 768x4 bits (address 100h ~ 3FFh) in bank 1 ~ bank 3.

The bank is selected by P9.

P9 Initial value : \* \* 0 0

*	*	RBK
RBK	RAM bank	
0 0	Bank0	
0 1	Bank1	
1 0	Bank2	
1 1	Bank3	

The Data Memory consists of three Address mode, namely -

#### (1) Indirect addressing mode:

The address in the bank is specified by the HL registers.

## Preliminary

PROGRAM EXAMPLE: Load the data of RAM address "143h" to RAM address "032h".

```

OUT  #0001B,P9      ; RAM bank1
LDL  #3h            ; LR← 3
LDH  #4h            ; HR← 4
LDAM                               ; Acc← RAM[134h]
OUT  #0000B,P9     ; RAM bank0
LDL  #2h            ; LR← 2
LDH  #3h            ; HR← 3
STAM                               ; RAM[023h]← Acc
    
```

(2) Direct addressing mode:

The address in the bank is directly specified by 8 bits code of the second byte in the instruction field.

PROGRAM EXAMPLE: Load the data of RAM address "143h" to RAM address "023h".

```

OUT  #0001B,P9
LDA  43h            ; Acc← RAM[143h]
OUT  #0000B,P9
STA  23h            ; RAM[023h]← Acc
    
```

(3) Zero-page addressing mode:

The zero-page is in the bank 0 (address 000h~00Fh). The address is the lower 4 bits code of the second byte in the instruction field.

PROGRAM EXAMPLE: Write immediate "0Fh" to RAM address "005h".

```

STD  #0Fh,05h      ; RAM[05h]← 0Fh
    
```

## PROGRAM COUNTER (16K ROM) Preliminary

Program counter ( PC ) is composed by a 13-bit counter, which indicates the next executed address for the instruction of program ROM instruction.

For BRANCH and CALL instructions, PC is changed by instruction indicating. PC only can indicate the address from 0000h-1FFFh. The bank number is decided by P3.

### (1) Branch instruction:

#### SBR a

Object code: 00aa aaaa

Condition: SF=1; PC ← PC<sub>12-6,a</sub> ( branch condition satisfied )

SF=0; PC ← PC + 1 ( branch condition not satisfied )

#### LBR a

Object code: 1100 aaaa aaaa aaaa

Condition: SF=1; PC ← PC<sub>12,a</sub> ( branch condition satisfied )

SF=0; PC ← PC + 2 ( branch condition not satisfied )

#### SLBR a

Object code: 0101 0101 1100 aaaa aaaa aaaa (a:1000h~1FFFh)

0101 0111 1100 aaaa aaaa aaaa (a:0000h~0FFFh)

Condition: SF=1; PC ← a ( branch condition satisfied )

SF=0 ; PC ← PC + 3 ( branch condition not satisfied )

### (2) Subroutine instruction:

#### SCALL a

Object code: 1110 nnnn

Condition : PC ← a ; a=8n+6 ; n=1..Fh ; a=86h, n=0

#### LCALL a

Object code: 0100 0aaa aaaa aaaa

Condition: PC ← a

## Preliminary

PC 

0	0	a	a	a	a	a	a	a	a	a	a	a	a
---	---	---	---	---	---	---	---	---	---	---	---	---	---

**RET**

Object code: 0100 1111

Condition: PC ← STACK[SP]; SP + 1

PC 

The return address stored in stack													
------------------------------------	--	--	--	--	--	--	--	--	--	--	--	--	--

**RTI**

Object code: 0100 1101

Condition : FLAG. PC ← STACK[SP]; EI ← 1; SP + 1

PC 

The return address stored in stack													
------------------------------------	--	--	--	--	--	--	--	--	--	--	--	--	--

**(3) Interrupt acceptance operation:**

When an interrupt is accepted, the original PC is pushed into stack and interrupt vector will be loaded into PC. The interrupt vectors are as follows :

$\overline{INT0}$  (External interrupt from P8.2)

PC 

0	0	0	0	0	0	0	0	0	0	0	0	1	0
---	---	---	---	---	---	---	---	---	---	---	---	---	---

SPI (speech end interrupt)

PC 

0	0	0	0	0	0	0	0	0	0	0	1	0	0
---	---	---	---	---	---	---	---	---	---	---	---	---	---

TRGA (Timer A overflow interrupt)

PC 

0	0	0	0	0	0	0	0	0	0	1	1	0
---	---	---	---	---	---	---	---	---	---	---	---	---

TRGB (Time B overflow interrupt)

PC 

0	0	0	0	0	0	0	0	0	1	0	0	0
---	---	---	---	---	---	---	---	---	---	---	---	---

TBI (Time base interrupt)

PC 

0	0	0	0	0	0	0	0	0	1	0	1	0
---	---	---	---	---	---	---	---	---	---	---	---	---

$\overline{INT1}$  (External interrupt from P8.0)

PC 

0	0	0	0	0	0	0	0	0	1	1	0	0
---	---	---	---	---	---	---	---	---	---	---	---	---

**(4) Reset operation:**

PC 

0	0	0	0	0	0	0	0	0	0	0	0	0	0
---	---	---	---	---	---	---	---	---	---	---	---	---	---

## Preliminary

### (5) Other operations:

For 1-byte instruction execution: PC + 1

For 2-byte instruction execution: PC + 2

For 3-byte instruction execution: PC + 3

### ACCUMULATOR

Accumulator(ACC) is a 4-bit data register for temporary data storage. For the arithmetic, logic and comparative operation..., ACC plays a role which holds the source data and result.

### FLAGS

There are three kinds of flag, CF ( Carry flag ), ZF ( Zero flag ) and SF ( Status flag ), these three 1-bit flags are included by the arithmetic, logic and comparative .... operation.

All flags will be put into stack when an interrupt subroutine is served, and the flags will be restored after RTI instruction is executed.

#### (1) Carry Flag ( CF )

The carry flag is affected by the following operations:

- a. Addition : CF as a carry out indicator, under addition operation, when a carry-out occurs, the CF is "1", likewise, if the operation has no carry-out, CF is "0".
- b. Subtraction : CF as a borrow-in indicator, under subtraction operation, when a borrow occurs, the CF is "0", likewise, if there is no borrow-in, the CF is "1".
- c. Comparison : CF as a borrow-in indicator for Comparison operation as in the subtraction operation.
- d. Rotation : CF shifts into the empty bit of accumulator for the rotation and holds the shift out data after rotation.
- e. CF test instruction : Under TFCFC instruction, the CF content is sent into SF then clear itself as "0". Under TTSFC instruction, the CF content is sent into SF then set itself as "1".

#### (2) Zero Flag ( ZF )

ZF is affected by the result of ALU, if the ALU operation generates a "0" result, the ZF is "1", likewise, the ZF is "0".

#### (3) Status Flag ( SF )

The SF is affected by instruction operation and system status.

- a. SF is initiated to "1" for reset condition.
- b. Branch instruction is decided by SF, when SF=1, branch condition is satisfied, likewise, when SF = 0, branch condition is unsatisfied.

## Preliminary

### PROGRAM EXAMPLE:

Check following arithmetic operation for CF, ZF, SF

	CF	ZF	SF
LDIA #00h;	-	1	1
LDIA #03h;	-	0	1
ADDA #05h;	-	0	1
ADDA #0Dh;	-	0	0
ADDA #0Eh;	-	0	0

### ALU

The arithmetic operation of 4-bit data is performed in ALU unit. There are 2 flags that can be affected by the result of ALU operation, ZF and SF. The operation of ALU is affected by CF only.

### ALU STRUCTURE

ALU supported user arithmetic operation functions, including Addition, Subtraction and Rotation.

### ALU FUNCTION

#### (1) Addition:

ALU supports addition function with instructions ADDAM, ADCAM, ADDM #k, ADD #k,y .... . The addition operation affects CF and ZF. Under addition operation, if the result is "0", ZF will be "1", otherwise, ZF will be "0". When the addition operation has a carry-out, CF will be "1", otherwise, CF will be "0".

#### EXAMPLE:

Operation	Carry	Zero
3+4=7	0	0
7+F=6	1	0
0+0=0	0	1
8+8=0	1	1

#### (2) Subtraction:

ALU supports subtraction function with instructions SUBM #k, SUBA #k, SBCAM, DECM... . The subtraction operation affects CF and ZF. Under subtraction operation, if the result is negative, CF will be "0", and a borrow out, otherwise, if the result is positive, CF will be "1". For ZF, if the result of subtraction operation is "0", the ZF is "1", likewise, ZF is "1".

## Preliminary

EXAMPLE:

Operation	Carry	Zero
8-4=4	1	0
7-F= -8(1000)	0	0
9-9=0	1	1

(3) Rotation:

Two types of rotation operation are available, one is rotation left, the other is rotation right. RLCA instruction rotates Acc value counter-clockwise, shift the CF value into the LSB bit of Acc and hold the shift out data in CF.

RRCA instruction operation rotates Acc value clockwise, shift the CF value into the MSB bit of Acc and hold the shift out data in CF.

PROGRAM EXAMPLE: To rotate Acc clockwise (right) and shift a "1" into the MSB bit of Acc.  
TTCFS; CF ← 1  
RRCA; rotate Acc right and shift CF=1 into MSB.

### HL REGISTER

HL register are two 4-bit registers, they are used as a pair of pointer for the RAM memory address. They are used as also 2 independent temporary 4-bit data registers. For certain instructions, L register can be a pointer to indicate the pin number (Port4 only).

### HL REGISTER STRUCTURE

### HL REGISTER FUNCTION

(1) HL register is used as a temporary register for instructions : LDL #k, LDH #k, THA, THL, INCL, DECL, EXAL, EXAH.

PROGRAM EXAMPLE: Load immediate data "5h" into L register, "0Dh" into H register.  
LDL #05h;  
LDH #0Dh;

(2) HL register is used as a pointer for the address of RAM memory for instructions : LDAM, STAM, STAMI ..

PROGRAM EXAMPLE: Store immediate data "#0Ah" into RAM of address 35h.

## Preliminary

```
LDL #5h;
LDH #3h;
STDMI #0Ah; RAM[35] ← Ah
```

- (3) L register is used as a pointer to indicate the bit of I/O port for instructions : SELP, CLPL, TFPL,  
(When LR = 0 indicate P4.0)

PROGRAM EXAMPLE: To set bit 0 of Port4 to "1"

```
LDL #00h;
SEPL ; P4.0 ← 1
```

### STACK POINTER (SP)

Stack pointer is a 4-bit register that stores the present stack level number.  
Before using stack, user must set the SP value first, CPU will not initiate the SP value after reset condition.  
When a new subroutine is received, the SP is decreased by one automatically, likewise, if returning from a subroutine, the SP is increased by one.  
The data transfer between ACC and SP is done with instructions "LDASP" and "STASP".

### DATA POINTER (DP)

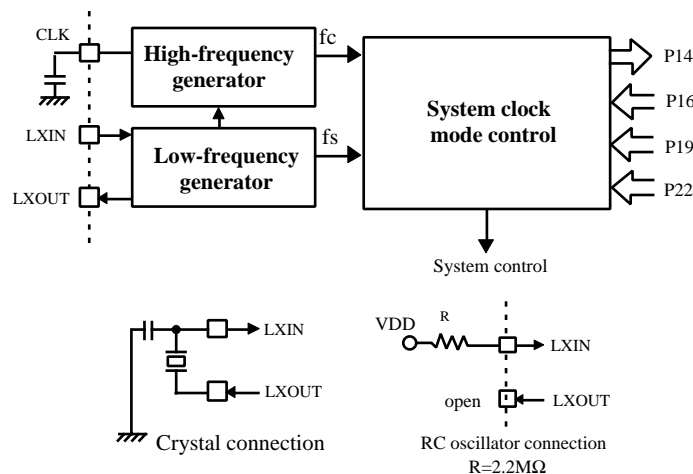

Data pointer is a 12-bit register that stores the ROM address can indicating the ROM code data specified by user (refer to data ROM).

### CLOCK AND TIMING GENERATOR

The clock generator is supported by a dual clock system. The high-frequency oscillator is internal oscillator. The low-frequency oscillator may be sourced from crystal, the working frequency is 32 KHz.

### CLOCK GENERATOR STRUCTURE

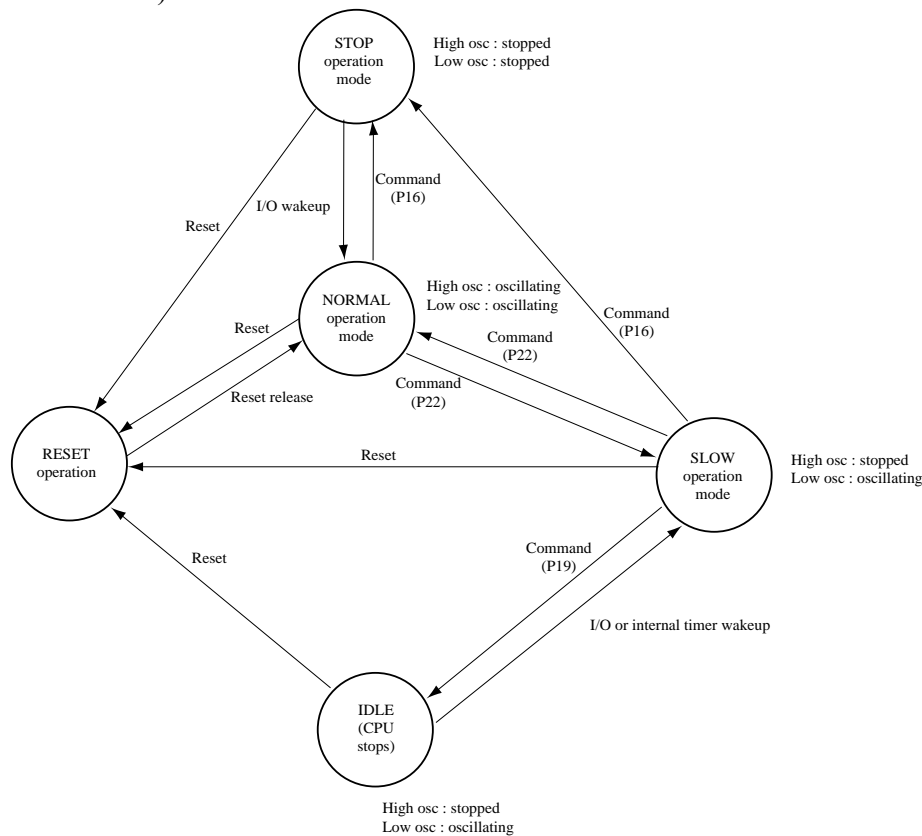

There are two clock generator for system clock control unit, P14 is the status register that hold the CPU status. P16, P19 and P22 are the command register for system clock mode control.

**Preliminary**

**SYSTEM CLOCK MODE CONTROL**

The system clock mode controller can start or stop the high-frequency and low-frequency clock oscillator and switch between the basic clocks. EM73A89B has four operation modes (DUAL, SLOW, IDLE and STOP operation modes).

Operation Mode	Oscillator	System Clock	Available function	One instruction cycle
NORMAL	High, Low frequency	High frequency clock	LCD, speech, HTC.	8 / fc
SLOW	Low frequency	Low frequency clock	LCD, HTC	4 / fs
IDLE	Low frequency	CPU stops	LCD	-
STOP	None	CPU stops	All disable	-

**DUAL OPERATION MODE**

The 4-bit  $\mu$ c is in the DUAL operation mode when the CPU is reseted. This mode is dual clock system (high-frequency and low-frequency clocks oscillating). It can be changed to SLOW or STOP operation mode with the command register (P22 or P16).

LCD display, speech synthesizer and sound generator are available for the DUAL operation mode.

**SLOW OPERATION MODE**

The SLOW operation mode is single clock system (low-frequency clock oscillating). It can be changed to the DUAL operation mode with the command register (P22), STOP operation mode with P16 and IDLE operation mode with P19.

LCD display is available for the SLOW operation mode. Speech synthesizer and sound generator are disabled in this mode.

**Preliminary**

P22      3      2      1      0      Initial value : \*\*\*0

*	*	*	SOM
---	---	---	-----

SOM	Select operation mode
0	DUAL operation mode
1	SLOW operation mode

P14      3      2      1      0      Initial value : 0000

ACT	WKS	SINT	CPUS
-----	-----	------	------

CPUS	CPU status	WKS	Wakeup status
0	DUAL operation mode	0	Wakeup not by internal timer
1	SLOW operation mode	1	Wakeup by internal timer

Port14 is the status register for CPU. P14.0 (CPU status) is a read-only bit. P14.2 (wakeup status) will be set as "1" when CPU is waked by internal timer. P14.2 will be cleared as "0" when user out data to P14. P14.1 is the interrupt source selector (refer to interrupt). P14.3 is the speech acknowledge signal (refer to speech synthesizer control).

### IDLE OPERATION MODE

The IDLE operation mode suspends all CPU functions except the low-frequency clock oscillation and the LCD driver. It keeps the internal status with low power consumption without stopping the slow clock oscillator and LCD display.

LCD display is available for the IDLE operation mode. The high speed counter and speech synthesizer are disabled in this mode. The IDLE operation mode will be wakeup and return to the SLOW operation mode by the internal timing generator or I/O pins (P0(0..3)/WAKEUP 0..3 and P8(0..3)/WAKEUPA..D).

P19      3      2      1      0      Initial value : 0000

IDME	SIDR
------	------

IDME	Enable IDLE mode	SIDR	Select IDLE releasing condition
0 1	Enable IDLE mode	0 0	P0(0..3), P8(0..3) pin input
* *	no function	0 1	P0(0..3), P8(0..3) pin input and 1 sec signal
		1 0	P0(0..3), P8(0..3) pin input and 0.5 sec signal
		1 1	P0(0..3), P8(0..3) pin input and 15.625 ms signal

### STOP OPERATION MODE

The STOP operation mode suspends system operation and holds the internal status immediately before the suspension with low power consumption. This mode will be released by reset or I/O pins (P0(0..3)/WAKEUP 0..3 or P8(0..3)/WAKEUP A..D).

LCD display, high speed counter and speech synthesizer are disabled in this mode.

**Preliminary**

P16    3    2    1    0                    Initial value : \*000

*	SWWT
---	------

SWWT	Enable STOP mode
1 0 1	Enable STOP mode
* * *	no function

### GENERAL PURPOSE REGISTER (P10)

P10 is a 4-bit general purpose register which can be read, written and rested by all I/O instructions. (including : INA, INM, OUT, OUTA, OUTM, SEP, CLP, TTP, TFP)

#### PROGRAM EXAMPLE:

```

CHIP ROM16K
;-----RAM define area-----
DSEG
ORG 10H
HLBUF: RES 2 ; HL buffer for interrupt
P9BUF: RES 1 ; P9 (RAM bank) buffer for interrupt
:
;-----Interrupt subroutine-----
CSEG
ORG 004H
LBR SPI
:
SPI: OUTA P10 ; save Acc to general purpose register P10
INA P9
OUT #0000B,P9
STA P9BUF ; save RAM bank to P9BUF
EXHL HLBUF ; save HL to HLBUF
:
:
EXHL HLBUF ; restore HLBUF to HL
LDA P9BUF ; restore P9BUF to RAM bank
OUTA P9
INA P10 ; restore register P10 to Acc
RTI

```

} 10 instruction bytes

} 10 instruction bytes

Preliminary

### TIME BASE INTERRUPT (TBI)

The time base can be used to generate a single fixed frequency interrupt. Eight types of frequencies can be selected with the "P25" setting.

P25    3    2    1    0  
    initial value : 0000

P25	NORMAL operation mode	SLOW operation mode
0 0 x x	Interrupt disable	Interrupt disable
0 1 0 0	Interrupt frequency LXIN / 2 <sup>3</sup> Hz	Reserved
0 1 0 1	Interrupt frequency LXIN / 2 <sup>15</sup> Hz	Interrupt frequency LXIN / 2 <sup>15</sup> Hz
0 1 1 0	Interrupt frequency LXIN / 2 <sup>5</sup> Hz	Reserved
0 1 1 1	Interrupt frequency LXIN / 2 <sup>14</sup> Hz	Interrupt frequency LXIN / 2 <sup>14</sup> Hz
1 1 0 0	Interrupt frequency LXIN / 2 <sup>1</sup> Hz	Reserved
1 1 0 1	Interrupt frequency LXIN / 2 <sup>6</sup> Hz	Interrupt frequency LXIN / 2 <sup>6</sup> Hz
1 1 1 0	Interrupt frequency LXIN / 2 <sup>8</sup> Hz	Interrupt frequency LXIN / 2 <sup>8</sup> Hz
1 1 1 1	Interrupt frequency LXIN / 2 <sup>10</sup> Hz	Interrupt frequency LXIN / 2 <sup>10</sup> Hz
1 0 x x	Reserved	Reserved

### TIMER / COUNTER (TIMER A, TIMER B)

Timer/counters support three special functions:

1. Even counter
2. Timer.
3. Pulse-width measurement.

These three functions can be executed by 2 timer/counter independently.

With timerA, the counter data is saved in timer register TAH, TAM, TAL. User can set counter initial value and read the counter value by instruction "LDATAH(M,L)" and "STATAH(M,L)". With timer B register is TBH, TBM, TBL and the W/R instruction are "LDATBH (M,L)" and "STATBH (M,L)". The basic structure of timer/counter is composed by two identical counter module, these two modules can be set initial timer or counter value to the timer registers, P28 and P29 are the command registers for timerA and timer B, user can choose different operation modes and internal clock rates by setting these two registers. When timer/counter overflows, it will generate a TRGA(B) interrupt request to interrupt control unit.

## Preliminary

### TIMER/COUNTER CONTROL

P8.1/TRGB, P8.3/TRGA are the external timer inputs for timerB and timerA, they are used in event counter and pulse-width measurement mode.

Timer/counter command port: P28 is the command port for timer/counterA and P29 is for the timer/counterB.

P28, P29    3   2   1   0                    Initial value : 0000

TMSA(B)	IPSA(B)
---------	---------

TMSA(B)	Mode selection
0 0	Stop
0 1	Event counter mode
1 0	Timer mode
1 1	Pulse width measurement mode

IPSA	Clock rate selection		IPSB	Clock rate selection	
	NORMAL mode	SLOW mode		NORMAL mode	SLOW mode
0 0	LXIN/2 <sup>3</sup> HZ	Reserved	0 0	Depend on high speed timer/counter	
0 1	LXIN/2 <sup>7</sup> HZ	LXIN/2 <sup>7</sup> HZ	0 1	LXIN/2 <sup>5</sup> HZ	LXIN/2 <sup>5</sup> HZ
1 0	LXIN/2 <sup>11</sup> HZ	LXIN/2 <sup>11</sup> HZ	1 0	LXIN/2 <sup>9</sup> HZ	LXIN/2 <sup>9</sup> HZ
1 1	LXIN/2 <sup>15</sup> HZ	LXIN/2 <sup>15</sup> HZ	1 1	LXIN/2 <sup>13</sup> HZ	LXIN/2 <sup>13</sup> HZ

### TIMER/COUNTER FUNCTION

Timer/counterA,B are programmable for timer, event counter and pulse width measurement mode. Each timer/counter can execute any of these functions independently.

#### EVENT COUNTER MODE

Under event counter mode, the timer/counter is increased by one at any rising edge of P8.1/TRGB for timerB (P8.3/TRGA for timer A). When timerB (timerA) counts overflow, it will provide an interrupt request TRGB (TRGA) to interrupt control unit.

PROGRAM EXAMPLE: Enable timerA with P28

```
LDIA    #0100b;
OUTA    P28    ; Enable timerA with event counter mode
```

## Preliminary

### TIMER MODE

Under timer mode, the timer/counter is increased by one at any rising edge of internal pulse. User can choose up to 4 types of internal pulse rate by setting IPSB for timerB (IPSA for timerA).

When timer/counter counts overflow, an interrupt request will be sent to interrupt control unit.

**PROGRAM EXAMPLE:** To generate TRGA interrupt request after 60 ms with system clock LXIN=32KHz

```
LDIA    #0100B    ;
EXAE    ; enable mask 2
EICIL   110111b  ; interrupt latch ←0, enable EI
LDIA    #0Ah;
STATAL;
LDIA    #00h;
STATAM;
LDIA    #0Fh;
STATAH;
LDIA    #1000B;
OUTA    P28      ; enable timerA with internal pulse rate: LXIN/23 Hz
```

**NOTE:** The preset value of timer/counter register is calculated as following procedure.  
 Internal pulse rate:  $LXIN/2^3$  ;  $LXIN = 32KHz$   
 The time of timer counter count one =  $2^3 / LXIN = 8/32768=0.244ms$   
 The number of internal pulse to get timer overflow =  $60 ms/0.244ms = 245.901= 0F6h$   
 The preset value of timer/counter register =  $1000h - 0F6h = F0Ah$

### PULSE WIDTH MEASUREMENT MODE

Under the pulse width measurement mode, the counter is increased at the rising edge of internal pulse during external timer/counter input (P8.1/TRGB, P8.3/TRGA) in high level, interrupt request is generated as soon as timer/counter count overflow.

**PROGRAM EXAMPLE:** Enable timerA by pulse width measurement mode.

```
LDIA    #1100b ;
OUTA    P28    ; Enable timerA with pulse width measurement mode.
```

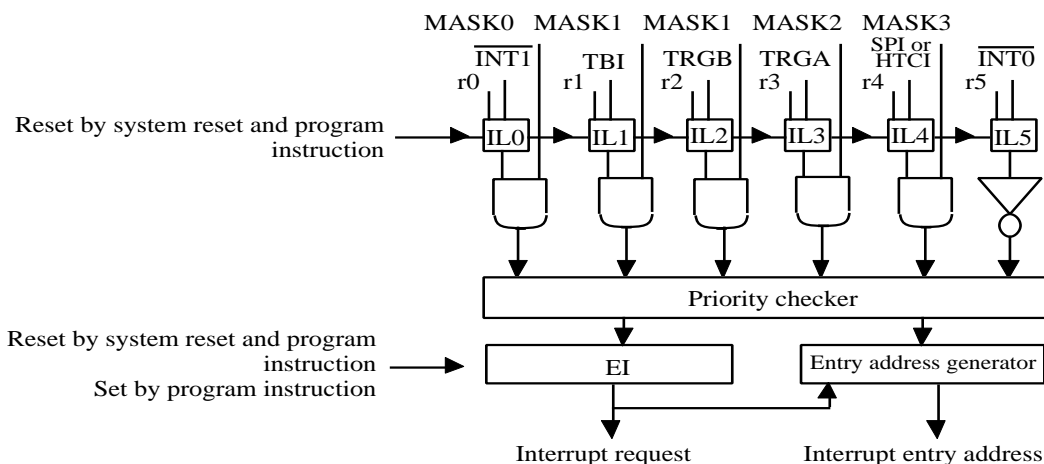

## Preliminary

### INTERRUPT FUNCTION

Six interrupt sources are available, 2 from external interrupt sources and 4 from internal interrupt sources. Multiple interrupts are admitted according to their priority.

Type	Interruptsource	Priority	Interrupt Latch	Interrupt Enablecondition	ProgramROM entry address
External	External interrupt (INT0)	1	IL5	EI=1	002h
Internal	Speech or HTC interrupt (SPI or HTCI)	2	IL4	EI=1, MASK3=1	004h
Internal	TimerA overflow interrupt (TRGA)	3	IL3	EI=1, MASK2=1	006h
Internal	TimerB overflow interrupt (TRGB)	4	IL2	EI=1, MASK1=1	008h
Internal	Time base interrupt (TBI)	5	IL1		00Ah
External	External interrupt (INT1)	6	IL0	EI=1, MASK0=1	00Ch

### INTERRUPT STRUCTURE

Interrupt controller:

IL0-IL5 : Interrupt latch. Hold all interrupt requests from all interrupt sources. IL's can not be set by program, but can be reset by program or system reset, so IL can only decide which interrupt source can be accepted.

MASK0-MASK3 : Except  $\overline{\text{INT0}}$ , MASK register may permit or inhibit all interrupt sources.

EI : Enable interrupt Flip-Flop may permit or inhibit all interrupt sources, when interrupt occurs, EI is auto cleared to "0", after RTI instruction is executed, EI is auto set to "1" again.

Priority checker : Check interrupt priority when multiple interrupts occur.

**Preliminary**

### INTERRUPT OPERATION

The procedure of interrupt operation:

1. Push PC and all flags to stack.
2. Set interrupt entry address into PC.
3. Set SF = 1.
4. Clear EI to inhibit other interrupts occur.
5. Clear the IL with which interrupt source has already been accepted.
6. Excute interrupt subroutine from the interrupt entry address.
7. CPU accept RTI, restore PC and flags from stack. Set EI to accept other interrupt requests.

PROGRAM EXAMPLE: To enable interrupt of "INT0, TRGA"

```
LDIA    #0100B ;
EXAE                    ; set mask register "0100b"
EICL    010111B ; enable interrupt F.F. and clear IL3 and IL5
```

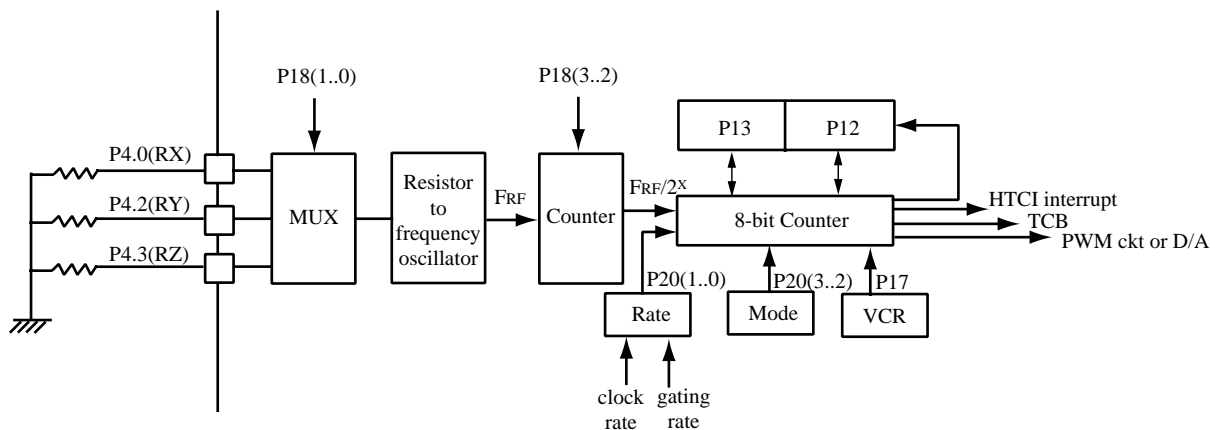

### INTERRUPT SOURCE SELECTION REGISTER

P14.1 is the interrupt source selection register for speech ending interrupt (SPI) and high speed counter overflow interrupt (HTCI) selection. When SINT=0, the program address "0004H" is the interrupt entry address of SPI. When SINT=1, the program address "0004H" is the interrupt entry address of HTCI. P14.0 and P14.2 are the CPU flages (refer to system operation mode). P14.3 is the speech acknowledge signal (refer to speech synthesizer control).

### HIGH SPEED COUNTER

EM73A89B has one high speed counter for resistor to frequency oscillation mode, melody mode and auto load timer mode. This function is available for the DUAL and SLOW operation mode. The resistor to frequency oscillation (RFO) circuit as show below :

## Preliminary

### CONTROL OF HIGH SPEED COUNTER

The high speed counter is controlled by the command registers (P20, P18) :

P20    3    2    1    0            Initial value : 0000

MODE	RATE
------	------

MODE	Selection of HTC mode
0 0	Disable HTC
0 1	Auto load timer mode
1 0	Melody mode
1 1	Resistor to frequency oscillation mode

RATE ( Hz )	Internal pulse rate / Counter start request frequency	
	Resistor to frequency oscillation mode	Auto load timer mode / Melody mode internal pulse rate
0 0	$LXIN / 2^6$	$CLK / 2^4$
0 1	$LXIN / 2^{10}$	$CLK / 2^5$
1 0	$LXIN / 2^{14}$	$CLK / 2^6$
1 1	$LXIN / 2^{15}$	$CLK / 2^7$

P18    3    2    1    0            Initial value : 0000

RFIP	RFIN
------	------

RFIP	Input frequency of RFO	RFIN	Selection of RFO Pin
0 0	$F_{RF}$	0 0	Normal I/O
0 1	$F_{RF} / 4$	0 1	P4.0 (RX) for RFO
1 0	$F_{RF} / 16$	1 0	P4.2 (RY) for RFO
1 1	$F_{RF} / 64$	1 1	P4.3 (RZ) for RFO

P12 and P13 are the 8-bit binary counter registers of the HTC. P12 is lower nibble register and P13 is higher nibble register.

P13

3	2	1	0
Higher nibble register			

P12

3	2	1	0
Lower nibble register			

Initial value : 0000 0000

The HTC can be set initial value and send counter value to counter registers (P13 and P12), P20 and P18 are the command ports for HTC, user can choose different operation mode and different internal clockrate by setting the port. The timer/counter increase one at the rising edge of internal pulse. The HTC can generate an overflow interrupt (HTCI) when it overflows. The HTCI can't be generated when the HTC is in the melody mode or disabled.

**Preliminary**

8-BIT BINARY COUNTER

Write the preset value to the registers

The value of 8-bit binary counter can be presetted by P13 and P12. The value of registers can be loaded into the 8-bit binary counter when the counter starts counting or occurs overflow. When the 8-bit binary counter overflows, the HTCI interrupt will be generated. If you write values to the registers before the next overflow occurs, the preset value can be changed.

Read the count value from the registers

The count value of 8-bit binary counter can be read out from P13 and P12. The value is unstable when you read out the value during counting. Thus, you must disable the counter before reading out the value.

20-BIT COUNTER FUNCTION

The 8-bit binary counter is connected to TCB which is one 12-bit general counter and becomes to the 20-bit counter. The TCB increases one when the 8-bit binary counter overflows and generates an overflow interrupt (TRGB) when the TCB overflows. The TRGB cannot be generated when the HTC is in the melody or disable.

FUNCTION OF HIGH SPEED COUNTER

The HTC has three modes which are RFO mode, melody mode and auto load timer mode.

The HTC is disabled when the CPU is reseted or in the STOP/IDLE operation mode. Users must enable it by yourself when the CPU is waked up.

Resistor to frequency oscillation mode

In this mode, the HTC is counted by the rising edges of input pulses from P4.1 (CS) and the value of window gate width is specified by P20. In this case, the window gate width interval is from the time base output fall to rise and the value of window gate width setting is the same as the time base interrupt frequency. The time base can be generated a fixed frequency interrupt when the time base interrupt (TBI) is enabled. The content of the HTC can be read and initialized by the TBI interrupt service routine.

ex. TBI interrupt frequency is  $LXIN/2^{15}$  Hz (P25=0101B). The pulse rate of RFO is  $LXIN/2^{15}$  Hz (P20=1111B). The window gate width of RFO is  $2^{14}/LXIN$  sec. (LXIN=32KHz)

**Preliminary**

## Preliminary

### Auto load timer mode

In this mode, there are four different internal pulse rates can be selected by P20. The HTC loads the initial values by the counter registers (P12, P13) and increases at the rising edges of internal pulse generated by the time base. The value of TCB increases one when the high speed counter overflows and generates an overflow interrupt (TRGB) when the TCB overflows. This mode is only available for DUAL operation mode.

### PROGRAM EXAMPLE :

```

LDIA          #00H          ; initial TCB & HTC register

STA           02H
LDATBM
STA           03H
LDATBH
STA           04H
    
```

### Melody mode

In the melody mode, HTC will output the square wave to the PWM circuit or D/A converter. The 8-bit tone frequency register is P13 and P12. The tone frequency will be changed when users output the different data to P12. Thus, the data must be output to P13 before P12 when users want to change the 8-bit tone frequency (TF). This mode is only available for DUAL operation mode.

\*\*  $F_{TONE} = [ (CLK / 2^X) / (100H - TF) ] / 2$ , TF = 0 ~ 255

\*\* Example : CLK = 4.6MHz, RATE = 10, TF = 11001110 B= 0CEH.  
 $F_{TONE} = [ (4.6MHz / 2^5) / (100H - 0CEH) ] / 2 = 1430 \text{ Hz.}$

## Preliminary

Volume control register (P17)

The are 16 levels of volume for sound generator. P17 is the volume control register.

Port17

Initial value : 0000

VCR				ts/tp
1	1	1	1	15/16
1	1	1	0	14/16
:	:	:	:	:
0	0	0	1	1/16

LDIA    #0EH
OUTA    P12
LDIA    #0111B           ; volume control
OUTA    P17
LDIA    #1010B           ; 1430 Hz tone output
OUTA    P20
    
```

**LCD DRIVER**

It can directly drive the liquid crystal display (LCD) and has 64 segment pins, 16 or 32 common pins by mask option. There are total 64x16 or 64x32 dots can be display. The V1~V5, VA and VB pins have to connect the capacitors for LCD voltage multiplier.

	<b>16 common pins</b>	<b>32 common pins</b>
Display dots	16x64 dots	32x64 dots
Bias	1/5 bias	1/5 bias
Duty	1/16 duty	1/32 duty
LCD display RAM	Bank2 (P9=xx10B)	Bank2(P9=xx10B), Bank3(P9=xx11B)
I/O or LCD pin by mask option	COM0..15, SEG0..59, P1[0..3]/SEG63..60	COM0..31, SEG0..43, P7[0..3]/SEG47..44, P6[0..3]/SEG51..48, P5[0..3]/SEG55..52, P2[0..3]/SEG59..56, P1[0..3]/SEG63..60

**Preliminary**

**LCD driver control command register (P27) :**

Port27    3   2   1   0    Initial value : 0000

LDC	LCD display control
0	LCD display disable
1	LCD display enable

VREF	Reference voltage	V5(1/5bias)*1
0 0 0	0.85V	4.25V
0 0 1	0.90V	4.50V
0 1 0	0.95V	4.75V
0 1 1	1.00V	5.00V
1 0 0	1.05V	5.25V
1 0 1	Reserved	Reserved
1 1 *	Reserved	Reserved

\* : Don't care.

\*1: V5 is LCD working voltage (suggestion only).

Example :

```
LDIA #1001B ; enable LCD.
OUTA P27
:
LDIA #0000B ; disable LCD.
OUTA P27
```

**LCD display data area:**

The LCD display data is stored in the display data area of the data memory (RAM).

**SPEECH SYNTHESIZER**

Block diagram of speech and sound effect

EM73A89B speech synthesizer operates as following :

1. Send the speech start address to the address latch by writing P24 four times.
2. Choose the sampling rate, enable the speech synthesizer by writing P23.
3. The ROM address counters send the ROM address A6 .. A19 to the speech ROM.
4. ACT is the speech acknowledge signal. When the speech synthesizer has voice output. ACT is high. When ACT is changed from high to low, the speech synthesizer can generate the speech ending interrupt SPI. The ACT signal can be read from P14.3.

**SPEECH SYNTHESIZER CONTROL**

Speech sample rate control register (P23 write) :

SR	Sample rate selection
0000	CLK/64/2/3
0001	CLK/64/2/4
0010	CLK/64/3/3
0011	CLK/64/3/4
0100	CLK/64/2/7
0101	CLK/64/4/4
0110	CLK/64/6/3
0111	CLK/64/6/4
1***	Disable speech

port 23 -- initialization is "1111".  
port 24 -- initialization is pointed to the low-nibble of start address latch.

The frequency of CLK is decided by mask option.

## Preliminary

Speech active flag (P14.3 read) :

ACT is the speech acknowledge signal. When the speech synthesizer has voice output, ACT is high. When ACT is high → low, the speech synthesizer can generate the speech ending interrupt SPI.

P14(0,2) are CPU status flags (refer to CPU status). P14.1 is the interrupt source selector (refer to interrupt).

Speech start address register (P24 write) :

Send the speech start address to the speech synthesizer by writing P24 four times. There is a pointer counter to point the address latch (P24L1, P24L2, P24L3, P24L4). It will increase one when write P24. So, the first time writing P24 to P24L1, the second time is P24L2, the third time is P24L3, the fourth time is P24L4 and the fifth time is P24L1 latch again, ... etc. The pointer counter point to P24L1 when CPU is reset or P23 is written. In the DUAL operation mode, the speech synthesizer is available. In the other operation modes, it is disable.

### PROGRAM EXAMPLE:

```

CHIP ROM16K
;-----RAMdefinearea-----
DSEG
ORG 10H
HLBUF: RES 2 ; HL buffer for interrupt
P9BUF: RES 1 ; P9 (RAM bank) buffer for interrupt
:
;-----Constant-----
ACT EQU 143
SPEECH EQU 43200H
:
;-----Interrupt subroutine-----
CSEG
ORG 004H
LBR SPI
:
SPI: OUTA P10 ; save Acc to general purpose register P10
INA P9
OUT #0000B,P9
STA P9BUF ; save RAM bank to P9BUF
EXHL HLBUF ; save HL to HLBUF
:
:
EXHL HLBUF ; restore HLBUF to HL
LDA P9BUF ; resotre P9BUF to RAM bank

OUTA P14 ; select SPI interrupt
LDIA #SPEECH/40H ; set speech start address
OUTA P24
LDIA #SPEECH/400H
OUTA P24
LDIA #SPEECH/4000H
OUTA P24
LDIA #SPEECH/40000H
OUTA P24
LDIA #0011B ; set sampling rate and start playing
OUTA P23
:
WAIT:
TTP P14,3 ; wait speed end
B WAIT
:
    
```

**USING SPEECH ROM AS DATA ROM**

The speech ROM can be used for speech synthesizer and for data ROM simultaneously. First, write initial address to P11 five times, then you can read P11 to get data, and the address counter increases one automatically. The read operation should be all done before you leave normal mode and change to slow mode.

Get speech ROM data (P11 read) :

Set speech ROM address (P11 write) :

**PROGRAM EXAMPLE:**

```

DATA_ADR EQU 12345H ; the start address of the speech ROM
:
LDIA #DATA_ADR
OUTA P11
LDIA #DATA_ADR/10H
OUTA P11
LDIA #DATA_ADR/100H
OUTA P11
LDIA #DATA_ADR/1000H
OUTA P11

OUTA P11
    
```

Preliminary

```

; READ DATA
INA          P11          ; read DATA_ADR
STA          TEMP
INA          P11
STA          TEMP+1
:
    
```

### WATCH-DOG-TIMER (WDT)

Watch-dog-timer can help user to detect the malfunction (runaway) of CPU and give system a timeup signal every certain time. User can use the time up signal to give system a reset signal when system is fail.

This function is available by mask option. If the mask option of WDT is enabled, it will stop counting when CPU is reseted or in the STOP operation mode.

The basic structure of Watch-Dog-Timer control is composed by a 4-stage binary counter and a control unit. The WDT counter counts for a certain time to check the CPU status, if there is no malfunction happened, the counter will be cleared and continue counting. Otherwise, if there is a malfunction happened, the WDT control will send a WDT signal (low active) to reset CPU. The WDT checking period is assign by P21 (WDT command port).

P21 is the control port of watch-dog-timer, and the WDT time up signal is connected to  $\overline{\text{RESET}}$ .

Port 21      3   2   1   0   Initial value :0000

CWC	*	*	WDT
-----	---	---	-----

CWC	Clear watchdog timer counter
0	Clear counter then return to 1
1	Nothing

WDT	Set watch-dog-timer detect time
0	$3 \times 2^{13}/\text{LXIN} = 3 \times 2^{13}/32\text{K Hz} = 0.75 \text{ sec}$
1	$7 \times 2^{13}/\text{LXIN} = 7 \times 2^{13}/32\text{K Hz} = 1.75 \text{ sec}$

#### PROGRAM EXAMPLE

To enable WDT with  $7 \times 2^{13}/\text{LXIN}$  detection time.

```

LDIA #0001B
OUTA P21 ; set WDT detection time and clear WDT counter
:
:
    
```

## Preliminary

### RESETTING FUNCTION

When CPU in normal working condition and  $\overline{\text{RESET}}$  pin is held in low level for three instruction cycles at least, then CPU begins to initialize the whole internal states, when  $\overline{\text{RESET}}$  pin changes to high level, CPU begins to work in normal condition.

The CPU internal state during reset condition is as following table :

Hardware condition in RESET state	Initial value
Program counter	0000h
Status flag	01h
Interrupt enable flip-flop ( EI )	00h
MASK0 ,1, 2, 3	00h
Interrupt latch ( IL )	00h
P3, 9, 10, 11, 12, 13, 14, 16, 18, 19, 20, 21, 22, 25, 27, 28, 29	00h
P0, 1, 2, 4, 5, 6, 7, 8, 17, 23, 24	0Fh
CLK, LXIN	Start oscillation

The  $\overline{\text{RESET}}$  pin is a hysteresis input pin and it has a pull-up resistor available by mask option. The simplest RESET circuit is connect  $\overline{\text{RESET}}$  pin with a capacitor to  $V_{SS}$  and a diode to  $V_{DD}$ .

### ABSOLUTE MAXIMUM RATINGS

Items	Sym.	Ratings	Conditions
Supply Voltage	$V_{DD}$	-0.5V to 3.6V	
Input Voltage	$V_{IN}$	-0.5V to $V_{DD}+0.5V$	
Output Voltage	$V_O$	-0.5V to $V_{DD}+0.5V$	
Power Dissipation	$P_D$	300mW	$T_{OPR}=50^{\circ}C$
Operating Temperature	$T_{OPR}$	-30°C to 70°C	
Storage Temperature	$T_{STG}$	-55°C to 125°C	

### RECOMMENDED OPERATING CONDITIONS

Items	Sym.	Ratings	Conditions
Supply Voltage	$V_{DD}$	2.2V to 3.6V	
Input Voltage	$V_{IH}$	$0.90 \times V_{DD}$ to $V_{DD}$	
	$V_{IL}$	0V to $0.10 \times V_{DD}$	
Operating Frequency	$F_C$	4.6MHz ~ 9.2MHz	CLK
	$F_S$	32KHz	LXIN,LXOUT

### DC ELECTRICAL CHARACTERISTICS ( $V_{DD}=3\pm 0.3V$ , $V_{SS}=0V$ , $T_{OPR}=25^{\circ}C$ )

Parameters	Sym.	Min.	Typ.	Max.	Unit	Conditions
Supply current	$I_{DD}$	-	0.5	1.2	mA	$V_{DD}=3.3V$ , DUAL mode, no load, $F_C=4.6MHz$ , $F_S=32KHz$
		-	35	45	$\mu A$	$V_{DD}=3.3V$ , SLOW mode, $F_S=32KHz$ , LCD on
		-	30	40	$\mu A$	$V_{DD}=3.3V$ , IDLE mode, LCD on
		-	7	12	$\mu A$	$V_{DD}=3.3V$ , IDLE mode, LCD off
		-	0.1	1	$\mu A$	$V_{DD}=3.3V$ , STOP mode
Hysteresis voltage	$V_{HYS+}$	$0.50V_{DD}$	-	$0.75V_{DD}$	V	RESET, P0, P8
	$V_{HYS-}$	$0.20V_{DD}$	-	$0.40V_{DD}$	V	
Input current	$I_{IH}$	-	-	$\pm 1$	$\mu A$	P0, RESET, $V_{DD}=3.3V$ , $V_{IH}=3.3/0V$
		-	-	$\pm 1$	$\mu A$	Open-drain, $V_{DD}=3.3V$ , $V_{IH}=3.3/0V$
	$I_{IL}$	-	-250	-500	$\mu A$	Push-pull (normal current push-pull) $V_{DD}=3.3V$ , $V_{IL}=0.4V$
		-	-20	-25	$\mu A$	Push-pull (low current push-pull) $V_{DD}=3.3V$ , $V_{IL}=0.4V$
Output voltage	$V_{OH}$	2.4	-	-	V	Push-pull, (high current push-pull) $V_{DD}=2.7V$ , $I_{OH}=-0.9mA$
		2.0	2.4	-	V	Push-pull, (normal current push-pull) $V_{DD}=2.7V$ , $I_{OH}=-40\mu A$
	$V_{OL}$	-	0.15	0.3	V	$V_{DD}=2.7V$ , $I_{OL}=0.9mA$
Leakage current	$I_{LO}$	-	-	1	$\mu A$	Open-drain, $V_{DD}=3.3V$ , $V_O=3.3V$
Input resistor	$R_{IN}$	100	200	300	K $\Omega$	P0, $V_{DD}=3.3V$
		300	600	900	K $\Omega$	RESET, $V_{DD}=3.3V$

**Preliminary**

Output current of BZ1, BZ2	$I_{OH}$	30	-	-	mA	$V_{DD}=3.0V, V_{BZ}=1.5V,$ mask option : small size
	$I_{OL}$	30	-	-	mA	
	$I_{OH}$	75	-	-	mA	$V_{DD}=3.0V, V_{BZ}=1.5V,$ mask option : large size
	$I_{OL}$	75	-	-	mA	
Output current of VO		2	3	4	mA	$V_{DD}=3.0V, v_o=0.7V$
LCD reference voltage	$V_{REF}$	0.765	0.85	0.935	V	$V_{DD}=3.0V, \text{no load}, VREF=000$
		0.81	0.90	0.99	V	$V_{DD}=3.0V, \text{no load}, VREF=001$
		0.855	0.95	1.045	V	$V_{DD}=3.0V, \text{no load}, VREF=010$
		0.9	1.00	1.1	V	$V_{DD}=3.0V, \text{no load}, VREF=011$
		0.945	1.05	1.155	V	$V_{DD}=3.0V, \text{no load}, VREF=100$

\*\*\*\* SYMBOL DESCRIPTION

Symbol	Description	Symbol	Description
HR	H register	LR	L register
PC	Program counter	DP	Data pointer
SP	Stack pointer	STACK[SP]	Stack specified by SP
A <sub>CC</sub>	Accumulator	FLAG	All flags
CF	Carry flag	ZF	Zero flag
SF	Status flag	EI	Enable interrupt register
IL	Interrupt latch	MASK	Interrupt mask
PORT[p]	Port ( address : p )	TA	Timer/counter A
TB	Timer/counter B	RAM[HL]	Data memory (address : HL )
RAM[x]	Data memory (address : x )	ROM[DP] <sub>L</sub>	Low 4-bit of program memory
ROM[DP] <sub>H</sub>	High 4-bit of program memory	[DP] <sub>L</sub>	Low 4-bit of data pointer register
[DP] <sub>M</sub>	Middle 4-bit of data pointer register	[DP] <sub>H</sub>	High 4-bit of data pointer register
[TA] <sub>L</sub> ([TB] <sub>L</sub> )	Low 4-bit of timer/counter A (timer/counter B) register	[TA] <sub>M</sub> ([TB] <sub>M</sub> )	Middle 4-bit of timer/counter A (timer/counter B) register
[TA] <sub>H</sub> ([TB] <sub>H</sub> )	High 4-bit of timer/counter A (timer/counter B) register	LR <sub>1-0</sub>	Contents of bit assigned by bit 1 to 0 of LR
LR <sub>3-2</sub>	Bit 3 to 2 of LR	a <sub>5-0</sub>	Bit 5 to 0 of destination address for branch instruction
PC <sub>12-6</sub>	Bit 12 to 6 of program counter	←	Transfer
↔	Exchange	+	Addition
-	Substraction	&	Logic AND
	Logic OR	^	Logic XOR
!	Inverse operation	.	Concatenation
#k	4-bit immediate data	x	8-bit RAM address
y	4-bit zero-page address	p	4-bit or 5-bit port address
b	Bit address	r	6-bit interrupt latch
