PFC and PWM Controller

## HITACHI

ADE-204-036D (Z)

Preliminary

Rev. 4

Sep. 2001

---

### Description

The HA16141P/FP and the HA16142P/FP are power supply controller ICs combining an AC-DC converter switching controllers for power factor correction and off-line power supply switching controllers. PFC (Power factor correction) section employs average current mode PWM and off-line power supply control section employs peak current mode PWM.

The HA16142P/FP is the change version of HA16141P/FP's PWM maximum on duty cycle.

The PFC operation can be turned on and off by external control signal. Use of this on/off function makes it possible to disable PFC operation at a low line voltage, or to perform remote control operation from the transformer secondary side. The PFC power supply boosted output voltage is not only fed to an error amplifier input signal but also fed to as the boost voltage monitor circuit.  $\overline{\text{PG}}$  signal is put out if the boost voltage is out-of-spec.

The PWM controller, which begins operation at the same time as release of the IC's UVLO (under-voltage lockout) is suitable for auxiliary power supply use in a multi-output power supply system.

### Features

- Synchronized PFC and PWM timing
- Self oscillation with fixed frequency
  - PFC : 100 kHz ( $\pm 15\%$ )
  - PWM : 200 kHz ( $\pm 15\%$ )
- PFC function on/off control
- PFC boosted output voltage monitor
- High-output current gate drivers
  - PFC driver peak current :  $\pm 1.5$  A typ.
  - PWM driver peak current :  $\pm 1.0$  A typ.
- PWM maximum on duty cycle
  - 72% min (HA16141P/FP)
  - 49.5% max (HA16142P/FP)

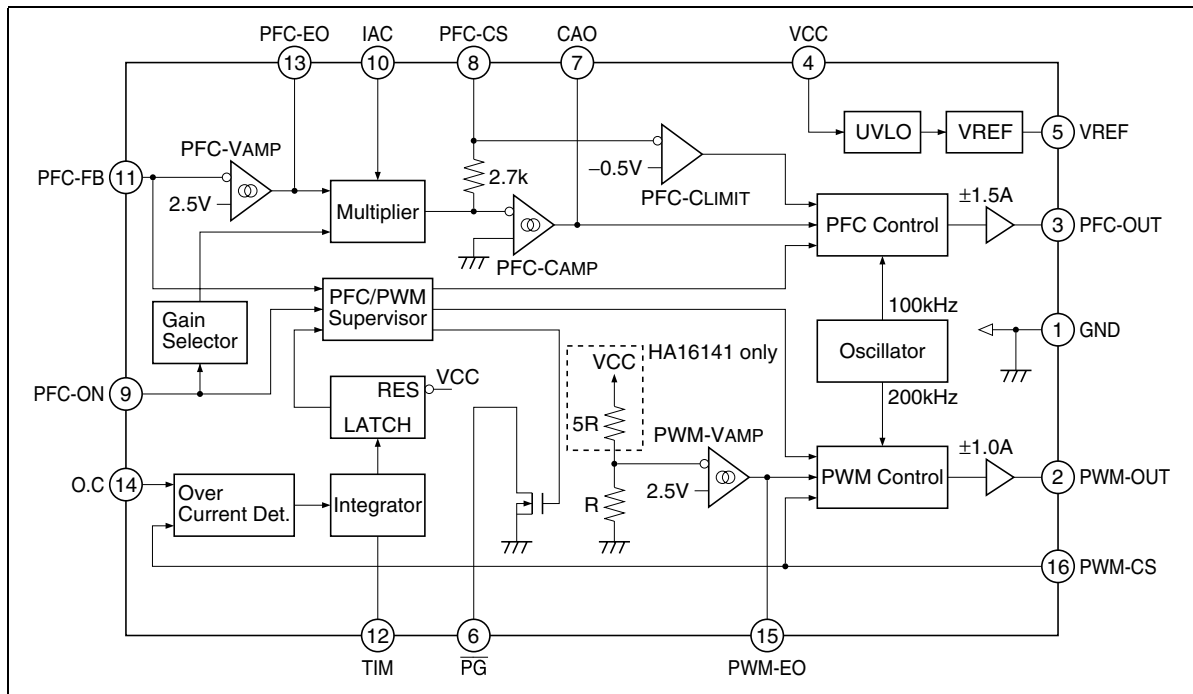

## Pin Arrangement

## Pin Description

Pin No.	Symbol	Function
1	GND	Ground
2	PWM-OUT	Power MOS FET driver output (PWM control)
3	PFC-OUT	Power MOS FET driver output (PFC control)
4	VCC	Supply voltage
5	VREF	Reference voltage
6	$\overline{\text{PG}}$	Power Good signal output (open-drain output)
7	CAO	Average current control error amp. output
8	PFC-CS	PFC control current sense signal input
9	PFC-ON	PFC function on/off signal input
10	IAC	Multiplier reference current input
11	PFC-FB	PFC control error amp. input
12	TIM	Overcurrent timer time setting
13	PFC-EO	PFC control error amp. output
14	O.C	Overcurrent detector signal input
15	PWM-EO	PWM control error amp. output (photocoupler input also possible) (HA16141 only) PWM control feedback voltage signal input (HA16142 only)
16	PWM-CS	PWM control current sense signal input

Block Diagram

**Absolute Maximum Ratings**

(Ta = 25°C)

Item	Symbol	Rating	Unit	Note
Supply voltage	V <sub>cc</sub>	20	V	
Peak PFC-OUT current	I <sub>pk-pfc</sub>	±1.5	A	3
Peak PWM-OUT current	I <sub>pk-pwm</sub>	±1.0	A	3
DC PFC-OUT current	I <sub>dc-pfc</sub>	±0.15	A	
DC PWM-OUT current	I <sub>dc-pwm</sub>	±0.10	A	
Terminal voltage	Vi-group1	-0.3 to V <sub>cc</sub>	V	4
	Vi-group2	-0.3 to V <sub>ref</sub>	V	5
CAO voltage	V <sub>cao</sub>	-0.3 to V <sub>eh-ca</sub>	V	
PFC-EO voltage	V <sub>pfc-eo</sub>	-0.3 to V <sub>eh-pfc</sub>	V	
PWM-EO voltage	V <sub>pwm-eo</sub>	-0.3 to V <sub>eh-pwm</sub>	V	
PFC-ON voltage	V <sub>pfc-on</sub>	-0.3 to +7	V	
IAC voltage	V <sub>i-ac</sub>	-0.3 to +5	V	
IAC current	I <sub>i-ac</sub>	0.8	mA	
PFC-CS voltage	V <sub>i-cs</sub>	-1.5 to +0.3	V	
TIM voltage	V <sub>i-tim</sub>	-0.3 to +6	V	
VREF current	I <sub>o-ref</sub>	-20	mA	
$\overline{\text{PG}}$ voltage	V <sub>o-pg</sub>	-0.3 to +7	V	
$\overline{\text{PG}}$ current	I <sub>o-pg</sub>	15	mA	
Power dissipation	P <sub>T</sub>	1	W	6
Operating temperature	T <sub>opr</sub>	-40 to +105	°C	
Storage temperature	T <sub>stg</sub>	-55 to +150	°C	
Junction temperature	T <sub>j</sub>	150	°C	

- Notes:
1. Rated voltages are with reference to the GND pin.
  2. For rated currents, inflow to the IC is indicated by (+), and outflow by (-).
  3. Shows the transient current when driving a capacitive load.
  4. Group1 is the rated voltage for the following pins: PFC-OUT, PWM-OUT
  5. Group2 is the rated voltage for the following pins: VREF, PFC-FB, PWM-CS
  6. This is the value when the ambient temperature (Ta) is 25°C or below. If Ta exceeds 25°C, the graph below applies. For the SOP package, this value is based on actual measurements on a 10% wiring density glass epoxy circuit board (40 mm × 40 mm × 1.6 mm).

Gain selector	Threshold voltage for K = 0.05	V <sub>KH</sub>	3.71	3.83	3.95	V	
	Threshold voltage for K = 0.25	V <sub>KL</sub>	3.51	3.63	3.75	V	
	V <sub>k</sub> hysteresis voltage	dV <sub>k</sub>	0.15	0.20	0.25	V	* <sup>1</sup>

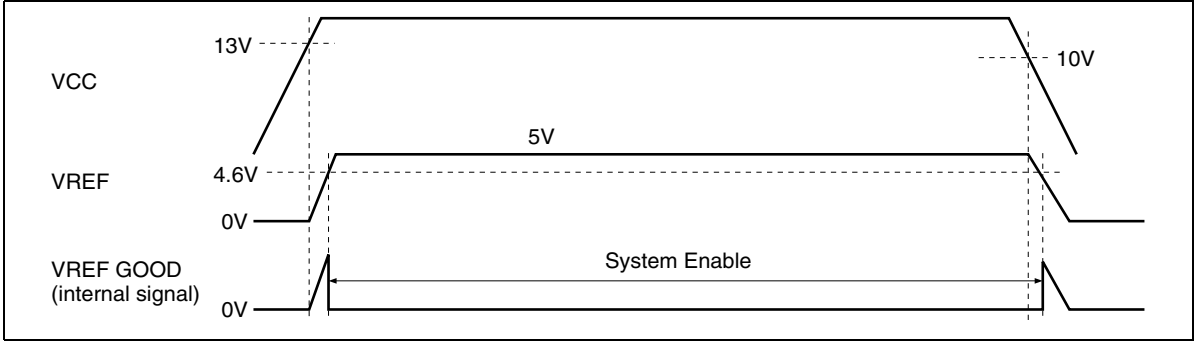

Notes: 1. Design spec.

2. I<sub>mo1</sub> to I<sub>mo4</sub> are defined as,  
I<sub>mo</sub> = (PFC-CS Terminal Current) - (I<sub>mo</sub>-offset)

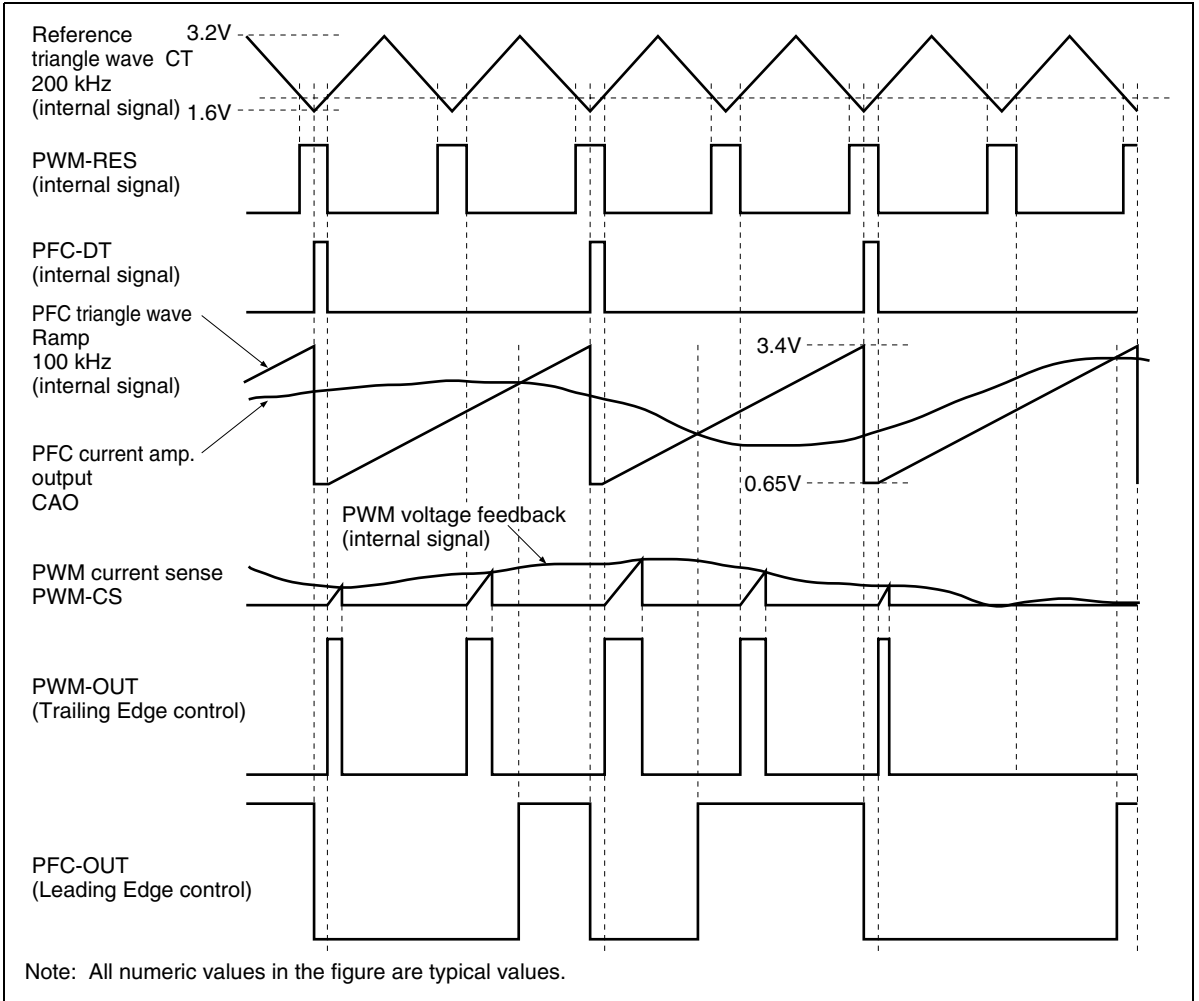

## Internal Timing

### 1. UVLO

### 2. Oscillator, Gate driver output

## 3. PFC controller status

Notes: 1. All numeric values in the figure are typical values.

### 2. PFC-ON

The HA16141P/FP can perform on/off control of the PFC function using the PFC-ON pin.

If an AC voltage that has undergone primary rectification and has been divided with an external resistance is input, PFC stoppage is possible in the event of a low input voltage.

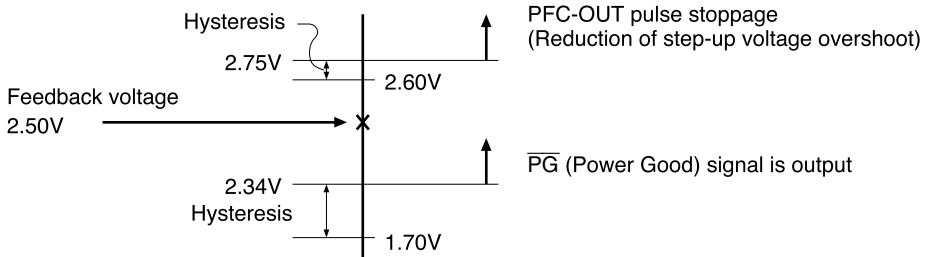

On/off control by means of a logic signal is also possible.

### 3. PFC-FB

The input to this pin is the voltage obtained by dividing the stepped-up PFC output voltage.

The pin voltage is fed back to the PFC control system, and is also used for step-up voltage logic decisions.

This is outlined in the figure below.

(Note 3 is continued on the next page)

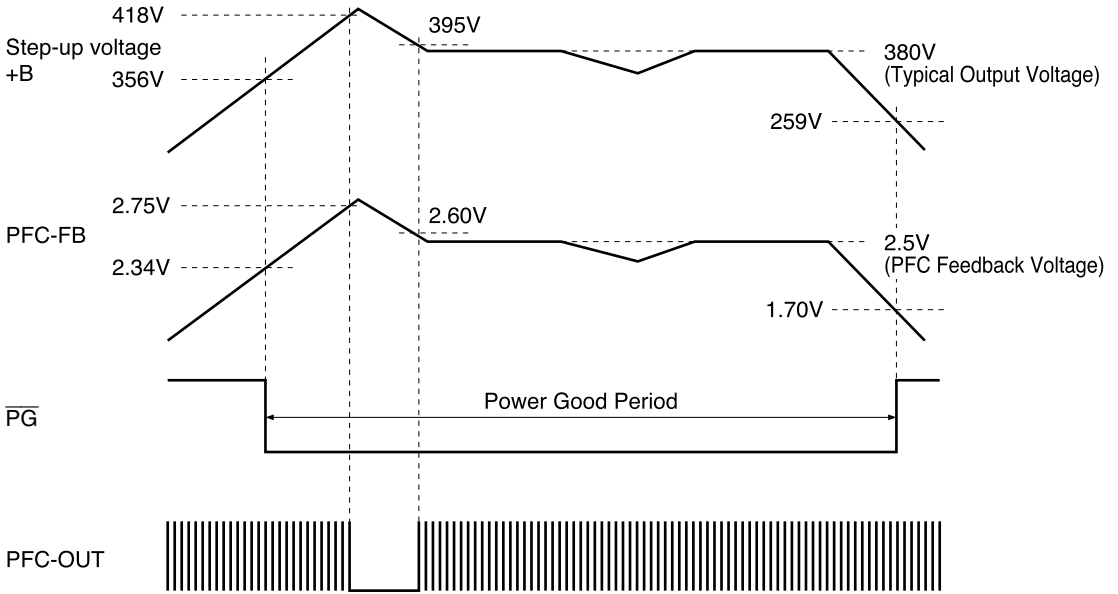

## 3. PFC controller status (cont.)

Notes: 3. PFC-FB (cont.)

The actual input voltage to the PFC-FB pin is the step-up voltage divided with a resistance (see figure below).  
 If R1 is set as 710 kΩ and R2 as 4.7 kΩ, the decision voltage at the step-up pin (+B) is as shown in the figure below.

Precondition: VREF GOOD, PFC-ON, Non latched.

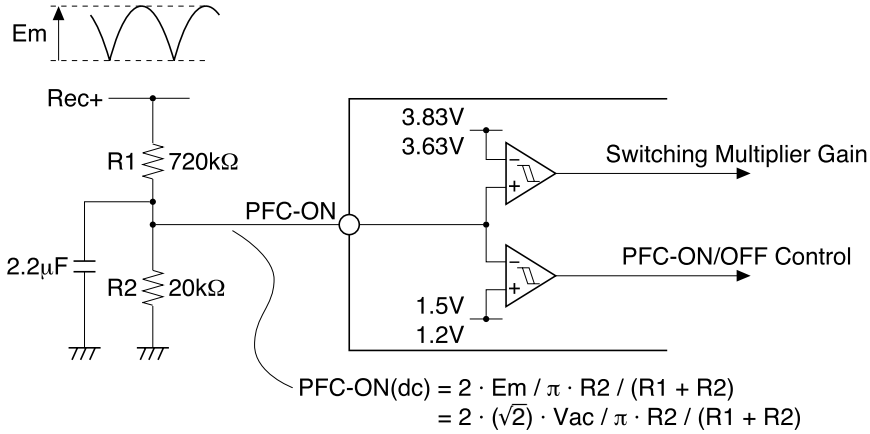

Notes: 4. All numeric values in the figure are typical values.

4. PFC-ON pin

The following functions are effected by inputting an AC voltage that has undergone primary rectification and has been divided with an external resistance to the PFC-ON pin (see figure below).

- a) Turning PFC operation off when AC voltage is low
- b) Switching multiplier gain with AC 100 V system and 200 V system input

Precondition: VREF GOOD, Non latched.

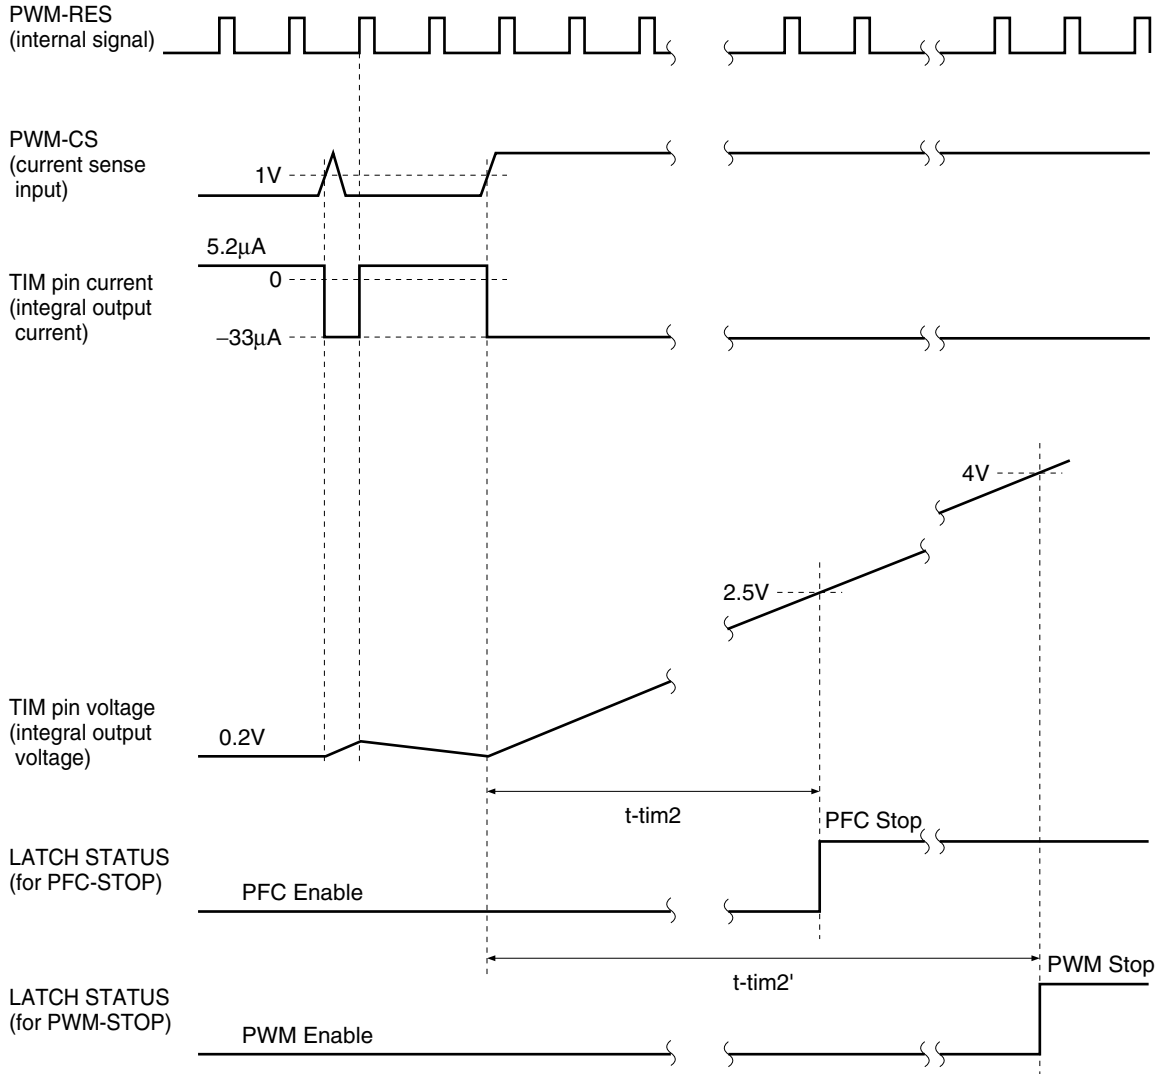

Note: All numeric values in the figure are typical values.

## 5. Integrator (OC detection operation)

6. Integrator (PWM-CS detection operation)

Note: Timer time calculation equation

Timer time  $t-tim2$  is the time until PG pin inversion (from low to high) after the PWM-CS pin trigger.  $t-tim2$  can be set using the following approximate equation.

$$t-tim2 = -C_{tim} \cdot (V_{lch} - pfc - 0.2V) / I_{src} - tim2$$

$$= -C_{tim} \cdot (2.5V - 0.2V) / (-33\mu A) \dots \dots \text{Typical calculation}$$

The time at which both the PFC and PWM functions are stopped by this timer can be calculated using the following approximate equation.

$$t-tim2' = 1.65 \cdot t - tim2 \dots \dots \text{Typical calculation}$$

## Mark Pattern

Notes: 1. Example of lot indication.

For example, a product manufactured in May 2000 has the markings "0E" in positions **1** **2** in the above figure.

Production		Indication	
Month	Year	<b>1</b>	<b>2</b>
May	2000	0	E

Month	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Code	A	B	C	D	E	F	G	H	J	K	L	M

2. Laser marking is used.
