1-to-64 bit variable length shift register

HEF4557B LSI

DESCRIPTION

The HEF4557B is a static clocked serial shift register whose length may be programmed to be any number of bits between 1 and 64. The number of bits selected is equal to the sum of the subscripts of the enabled length control inputs ($L_1, L_2, L_4, L_8, L_{16}$ and L_{32}) plus one. Serial data may be selected from the D_A or D_B data inputs with the A/\bar{B} select input. This feature is useful for recirculation

purposes. Information on D_A or D_B is shifted into the first register position and all the data in the register is shifted one position to the right on the LOW to HIGH transition of CP_0 while $\overline{CP_1}$ is LOW or on the HIGH to LOW transition of $\overline{CP_1}$ while CP_0 is HIGH. A HIGH on master reset (MR) resets the register and forces O to LOW and \bar{O} to HIGH, independent of the other inputs.

1. The moment D_n appears at O depends on the bit-length shown in the table below.
2. H = HIGH state (the more positive voltage)
3. L = LOW state (the less positive voltage)
4. X = state is immaterial
5. ↗ = positive-going transition
6. ↘ = negative-going transition
7. D_n = either HIGH or LOW
