

Radiation Hardened 8K x 8 SOS CMOS Static RAM

The Intersil HS-65647RH is a fully asynchronous 8K x 8 radiation hardened static RAM. This RAM is fabricated using the Intersil 1.2 micron silicon-on-sapphire CMOS technology. This technology gives exceptional hardness to all types of radiation, including neutron fluence, total ionizing dose, high intensity ionizing dose rates, and cosmic rays.

Low power operation is provided by a fully static design. Low standby power can be achieved without pull-up resistors, due to the gated input buffer design.

Specifications for Rad Hard QML devices are controlled by the Defense Supply Center in Columbus (DSCC). The SMD numbers listed here must be used when ordering.

Detailed Electrical Specifications for these devices are contained in SMD 5962-95823. A "hot-link" is provided on our homepage for downloading. www.intersil.com/spacedefense/space.asp

Features

- Electrically Screened to SMD # 5962-95823
- QML Qualified per MIL-PRF-38535 Requirements
- 1.2 Micron Radiation Hardened SOS CMOS
 - Total Dose 300 krad(Si) (Max)
 - Transient Upset >1 x 10¹¹ rad(Si)/s
 - Single Event Upset < 1 x 10⁻¹² Errors/Bit-Day
- Latch-up Free
- LET Threshold >250 MEV/mg/cm2
- Low Standby Supply Current 10mA (Max)
- Low Operating Supply Current 100mA (2MHz)
- Fast Access Time 50ns (Max), 35ns (Typ)
- High Output Drive Capability
- Gated Input Buffers (Gated by E2)
- Six Transistor Memory Cell
- Fully Static Design
- Asynchronous Operation
- CMOS Inputs
- 5V Single Power Supply
- Military Temperature Range -55°C to 125°C
- Industry Standard JEDEC Pinout

Test Patterns

MARCH (II) PATTERN

After a background of zeros is written, each cell (from beginning to end in sequence) is read, written to a one and reread. When the array is full of ones each cell (from the end to the beginning) is read, restored to a zero and reread.

After this the pattern is repeated but with complemented data.

MASEST PATTERN (Multiple Address Select Pattern)

A checkerboard pattern is written into the memory. Then the first cell is read, then its binary address complement is read. The second cell is read and then its binary address complement is read. This pattern of incrementing the address and then reading its binary address complement is repeated until the entire memory is read.

This is then repeated but using a checkerboard bar pattern.

GALROW PATTERN (Row Galloping Pattern)

After a background of zeros is written into the memory a one is written into the first cell. It is then read alternately with each other cell in the row. The test cell is then rewritten back to a zero. The test cell is then incremented and the sequence is repeated until all cells in the memory have been used as a test cell.

This is pattern then repeated but using complemented data.

GALCOL PATTERN (Column Galloping Pattern)

After a background of zeros is written into the memory a one is written into the first cell. It is then read alternately with each other cell in the column. The test cell is then rewritten back to a zero. The test cell is then incremented and the sequence is repeated until all cells in the memory have been used as a test cell.

This is pattern then repeated but using complemented data.

CHECKERBOARD PATTERN and CHECKERBOARD BAR

A checkerboard is written (101010) into the memory and then the pattern is read back. This is then repeated but using complemented data.
