

Frequency Generator for Modem Systems

General Description

The ICS9117-01 is a low-cost, high-performance frequency generator designed to support fax/data modem systems. Datapump and UART clocks are synthesized from a microcontroller crystal using high-accuracy, low-jitter PLLs, meeting the frequency tolerance and -96dB signal-to-noise ratios required by 16-bit DSP modem systems. Fast output clock edge rates minimize board induced jitter.

Exact frequency multiplying ratios ensure better than ± 80 ppm frequency accuracy using a standard AT crystal with external load capacitors (typically 33pF $\pm 5\%$ for an 18pF series load crystal). Achieving ± 80 ppm over four years requires the crystal to have 20 ppm initial accuracy, ± 20 ppm temperature and ± 5 ppm/year aging coefficients.

Features

- Generates the 14.7456 MHz microcontroller, 40.320 MHz datapump and 1.84320 UART clocks
- Less than ± 80 ppm frequency variation including temperature, voltage, load and aging tolerances
- Single crystal reference minimizes crystal reliability and inventory issues
- 80 ps one sigma jitter maintains 16-bit performance
- Output rise/fall times less than 1.5 ns
- On-chip loop filter components
- 3.0 V - 5.5 V supply range
- 8-pin, 150-mil SOIC package

Applications

- Specifically designed to support the high performance of fax/data modems
