

Low Power J-FET DUAL OPERATIONAL AMPLIFIERS

IL062

The IL062 is high speed J-FET input dual operational amplifier. This J-FET input operational amplifier incorporates well matched, high voltage J-FET and bipolar transistors in a monolithic integrated circuit. The devices feature high slew rates, low input bias and offset currents, and low offset voltage temperature coefficient.

- Operation Very low power consumption: 200 μ A
- Wide common-mode (up to V_{CC}^+) and differential voltage ranges
- Low input bias and offset currents
- Output short-circuit protection
- High input impedance J-FET input stage
- Internal frequency compensation
- Latch up free operation
- High slew rate: 3.5V/s

MAXIMUM RATING

Symbol	Parameter	IL062	Unit
V_{CC}	Supply Voltage – (note 1)	18	V
V_i	Input Voltage – (note 3)	15	V
V_{id}	Differential Input Voltage – (note 2)	30	V
P_{tot}	Power Dissipation	680	mW
	Output Short-Circuit Duration (Note 4)	Infinite	
T_{oper}	Operating Free-Air Temperature Range	-40 to +85	°C
T_{stg}	Storage Temperature Range	-65 to +150	°C

- Notes
1. All voltage values, except differential voltage, are with respect to the zero reference level (ground) of the supply voltages where the zero reference level is the midpoint between V_{CC}^+ and V_{CC}^- .
 2. Differential voltages are at the non-inverting input terminal with respect to the inverting input terminal.
 3. The magnitude of the input voltage must never exceed the magnitude of the supply voltage or 15 volts, whichever is less.
 4. The output may be shorted to ground or to either supply. Temperature and/or supply voltages must be limited to ensure that the dissipation rating is not exceeded.

* Input bias currents of a FET- input operational amplifier are normal junction reverse currents, which are temperature sensitive.

Pulse techniques must be used that will maintain the junction temperature as close to the ambient temperature as possible.
