

Document Title

64Kx36 & 64Kx32-Bit Synchronous Pipelined Burst SRAM

Revision History

<u>Rev. No</u>	<u>History</u>	<u>Draft Date</u>	<u>Remark</u>
0.0	1. Initial draft	Dec. 10. 2001	Preliminary
0.1	1. Add tCYC 250,225, 200MHz bin.	Jan . 17. 2002	Preliminary
1.0	1. Final spec release 2. Remove tCYC 225MHz(-22)	April. 01. 2002	Final
2.0	1. Remove the x18 organization 2. Remove tCYC 250/200/167MHz(-25/-20/-16)	Nov. 17. 2003	Final

The attached data sheets are prepared and approved by SAMSUNG Electronics. SAMSUNG Electronics CO., LTD. reserve the right to change the specifications. SAMSUNG Electronics will evaluate and reply to your requests and questions on the parameters of this device. If you have any questions, please contact the SAMSUNG branch office near your office, call or contact Headquarters.

2Mb SPB Synchronous SRAM Ordering Information

Org.	Part Number	Mode	VDD	Speed FT ; Access Time(ns) Pipelined ; Cycle Time(MHz)	PKG	Temp
64Kx32	K7A203200B-QC(I)14	SPB(2E1D)	3.3	138MHz	Q (100TQFP)	C (Commercial Temperature Range) I:(Industrial Temperature Range)
64Kx36	K7A203600B-QC(I)14	SPB(2E1D)	3.3	138MHz		

64Kx36 & 64Kx32-Bit Synchronous Pipelined Burst SRAM

FEATURES

- Synchronous Operation.
- 2 Stage Pipelined operation with 4 Burst.
- On-Chip Address Counter.
- Self-Timed Write Cycle.
- On-Chip Address and Control Registers.
- $V_{DD} = 3.3V + 0.3V / -0.165V$ Power Supply.
- V_{DDQ} Supply Voltage $3.3V + 0.3V / -0.165V$ for 3.3V I/O or $2.5V + 0.4V / -0.125V$ for 2.5V I/O.
- 5V Tolerant Inputs Except I/O Pins.
- Byte Writable Function.
- Global Write Enable Controls a full bus-width write.
- Power Down State via ZZ Signal.
- \overline{LBO} Pin allows a choice of either a interleaved burst or a linear burst.
- Three Chip Enables for simple depth expansion with No Data Contention ; 2cycle Enable, 1cycle Disable.
- Asynchronous Output Enable Control.
- \overline{ADSP} , \overline{ADSC} , \overline{ADV} Burst Control Pins.
- TTL-Level Three-State Output.
- 100-TQFP-1420A .
- Operating in commecal and industrial temperature range.

FAST ACCESS TIMES

PARAMETER	Symbol	-14	Unit
Cycle Time	tCYC	7.2	ns
Clock Access Time	tCD	4.0	ns
Output Enable Access Time	tOE	4.0	ns

GENERAL DESCRIPTION

The K7A203600B and K7A203200B are 2,359,296-bit Synchronous Static Random Access Memory designed for high performance second level cache of Pentium and Power PC based System.

It is organized as 64K words of 36/32 bits and integrates address and control registers, a 2-bit burst address counter and added some new functions for high performance cache RAM applications; \overline{GW} , \overline{BW} , \overline{LBO} , ZZ. Write cycles are internally self-timed and synchronous.

Full bus-width write is done by \overline{GW} , and each byte write is performed by the combination of \overline{WEx} and \overline{BW} when \overline{GW} is high. And with $\overline{CS1}$ high, \overline{ADSP} is blocked to control signals. Burst cycle can be initiated with either the address status processor(\overline{ADSP}) or address status cache controller(\overline{ADSC}) inputs. Subsequent burst addresses are generated internally in the system's burst sequence and are controlled by the burst address advance(\overline{ADV}) input.

\overline{LBO} pin is DC operated and determines burst sequence(linear or interleaved).

ZZ pin controls Power Down State and reduces Stand-by current regardless of CLK.

The K7A203600B and K7A203200B are fabricated using SAMSUNG's high performance CMOS technology and is available in a 100pin TQFP package. Multiple power and ground pins are utilized to minimize ground bounce.

<u>LBO</u>	Burst Mode Control	31			

FUNCTION DESCRIPTION

The K7A2036/3200B are synchronous SRAM designed to support the burst address accessing sequence of the P6 and Power PC based microprocessor. All inputs (with the exception of \overline{OE} , \overline{LBO} and \overline{ZZ}) are sampled on rising clock edges. The start and duration of the burst access is controlled by \overline{ADSC} , \overline{ADSP} and \overline{ADV} and chip select pins.

The accesses are enabled with the chip select signals and output enabled signals. Wait states are inserted into the access with \overline{ADV} . When \overline{ZZ} is pulled high, the SRAM will enter a Power Down State. At this time, internal state of the SRAM is preserved. When \overline{ZZ} returns to low, the SRAM normally operates after 2cycles of wake up time. \overline{ZZ} pin is pulled down internally.

Read cycles are initiated with \overline{ADSP} (regardless of \overline{WEx} and \overline{ADSC})using the new external address clocked into the on-chip address register whenever \overline{ADSP} is sampled low, the chip selects are sampled active, and the output buffer is enabled with \overline{OE} . In read operation the data of cell array accessed by the current address, registered in the Data-out registers by the positive edge of \overline{CLK} , are carried to the Data-out buffer by the next positive edge of \overline{CLK} . The data, registered in the Data-out buffer, are projected to the output pins. \overline{ADV} is ignored on the clock edge that samples \overline{ADSP} asserted, but is sampled on the subsequent clock edges. The address increases internally for the next access of the burst when \overline{WEx} are sampled High and \overline{ADV} is sampled low. And \overline{ADSP} is blocked to control signals by disabling $\overline{CS1}$.

All byte write is done by \overline{GW} (regardless of \overline{BW} and \overline{WEx}), and each byte write is performed by the combination of \overline{BW} and \overline{WEx} when \overline{GW} is high.

Write cycles are performed by disabling the output buffers with \overline{OE} and asserting \overline{WEx} . \overline{WEx} are ignored on the clock edge that samples \overline{ADSP} low, but are sampled on the subsequent clock edges. The output buffers are disabled when \overline{WEx} are sampled Low(regardless of \overline{OE}). Data is clocked into the data input register when \overline{WEx} sampled Low. The address increases internally to the next address of burst, if both \overline{WEx} and \overline{ADV} are sampled Low. Individual byte write cycles are performed by any one or more byte write enable signals(\overline{WEa} , \overline{WEb} , \overline{WEc} or \overline{WEd}) sampled low. The \overline{WEa} control $DQa0 \sim DQa7$ and $DQPa$, \overline{WEb} controls $DQb0 \sim DQb7$ and $DQPb$, \overline{WEc} controls $DQc0 \sim DQc7$ and $DQPc$, and \overline{WEd} control $DQd0 \sim DQd7$ and $DQPd$. Read or write cycle may also be initiated with \overline{ADSC} , instead of \overline{ADSP} . The differences between cycles initiated with \overline{ADSC} and \overline{ADSP} as are follows;

\overline{ADSP} must be sampled high when \overline{ADSC} is sampled low to initiate a cycle with \overline{ADSC} .

\overline{WEx} are sampled on the same clock edge that sampled \overline{ADSC} low(and \overline{ADSP} high).

Addresses are generated for the burst access as shown below, The starting point of the burst sequence is provided by the external address. The burst address counter wraps around to its initial state upon completion. The burst sequence is determined by the state of the \overline{LBO} pin. When this pin is Low, linear burst sequence is selected. When this pin is High, Interleaved burst sequence is selected.

BURST SEQUENCE TABLE

(Interleaved Burst)

\overline{LBO} PIN	HIGH	Case 1		Case 2		Case 3		Case 4	
		A1	A0	A1	A0	A1	A0	A1	A0
	First Address	0	0	0	1	1	0	1	1
	↓	0	1	0	0	1	1	1	0
	↓	1	0	1	1	0	0	0	1
	Fourth Address	1	1	1	0	0	1	0	0

Note : 1. \overline{LBO} pin must be tied to High or Low, and Floating State must not be allowed.

(Linear Burst)

\overline{LBO} PIN	LOW	Case 1		Case 2		Case 3		Case 4	
		A1	A0	A1	A0	A1	A0	A1	A0
	First Address	0	0	0	1	1	0	1	1
	↓	0	1	1	0	1	1	0	0
	↓	1	0	1	1	0	0	0	1
	Fourth Address	1	1	0	0	0	1	1	0

Note : 1. \overline{LBO} pin must be tied to High or Low, and Floating State must not be allowed.

ASYNCHRONOUS TRUTH TABLE

(See Notes 1 and 2):

OPERATION	\overline{ZZ}	\overline{OE}	I/O STATUS
Sleep Mode	H	X	High-Z
Read	L	L	DQ
	L	H	High-Z
Write	L	X	Din, High-Z
Deselected	L	X	High-Z

Notes

1. X means "Don't Care".
2. \overline{ZZ} pin is pulled down internally
3. For write cycles that following read cycles, the output buffers must be disabled with \overline{OE} , otherwise data bus contention will occur.
4. Sleep Mode means power down state of which stand-by current does not depend on cycle time.
5. Deselected means power down state of which stand-by current depends on cycle time.

TRUTH TABLES

SYNCHRONOUS TRUTH TABLE

\overline{CS}_1	CS_2	\overline{CS}_2	\overline{ADSP}	\overline{ADSC}	\overline{ADV}	\overline{WRITE}	CLK	ADDRESS ACCESSED	OPERATION
H	X	X	X	L	X	X	↑	N/A	Not Selected
L	L	X	L	X	X	X	↑	N/A	Not Selected
L	X	H	L	X	X	X	↑	N/A	Not Selected
L	L	X	X	L	X	X	↑	N/A	Not Selected
L	X	H	X	L	X	X	↑	N/A	Not Selected
L	H	L	L	X	X	X	↑	External Address	Begin Burst Read Cycle
L	H	L	H	L	X	L	↑	External Address	Begin Burst Write Cycle
L	H	L	H	L	X	H	↑	External Address	Begin Burst Read Cycle
X	X	X	H	H	L	H	↑	Next Address	Continue Burst Read Cycle
H	X	X	X	H	L	H	↑	Next Address	Continue Burst Read Cycle
X	X	X	H	H	L	L	↑	Next Address	Continue Burst Write Cycle
H	X	X	X	H	L	L	↑	Next Address	Continue Burst Write Cycle
X	X	X	H	H	H	H	↑	Current Address	Suspend Burst Read Cycle
H	X	X	X	H	H	H	↑	Current Address	Suspend Burst Read Cycle
X	X	X	H	H	H	L	↑	Current Address	Suspend Burst Write Cycle
H	X	X	X	H	H	L	↑	Current Address	Suspend Burst Write Cycle

- Notes :** 1. X means "Don't Care". 2. The rising edge of clock is symbolized by ↑.
 3. $\overline{WRITE} = L$ means Write operation in WRITE TRUTH TABLE.
 $\overline{WRITE} = H$ means Read operation in WRITE TRUTH TABLE.
 4. Operation finally depends on status of asynchronous input pins(\overline{ZZ} and \overline{OE}).

WRITE TRUTH TABLE(x36/32)

\overline{GW}	\overline{BW}	\overline{WEa}	\overline{WEb}	\overline{WEc}	\overline{WEd}	OPERATION
H	H	X	X	X	X	READ
H	L	H	H	H	H	READ
H	L	L	H	H	H	WRITE BYTE a
H	L	H	L	H	H	WRITE BYTE b
H	L	H	H	L	L	WRITE BYTE c and d
H	L	L	L	L	L	WRITE ALL BYTES
L	X	X	X	X	X	WRITE ALL BYTES

- Notes :** 1. X means "Don't Care".
 2. All inputs in this table must meet setup and hold time around the rising edge of CLK(↑).

ABSOLUTE MAXIMUM RATINGS*

PARAMETER	SYMBOL	RATING	UNIT
Voltage on V _{DD} Supply Relative to V _{SS}	V _{DD}	-0.3 to 4.6	V
Voltage on V _{DDQ} Supply Relative to V _{SS}	V _{DDQ}	V _{DD}	V
Voltage on Input Pin Relative to V _{SS}	V _{IN}	-0.3 to V _{DD} +0.3	V
Voltage on I/O Pin Relative to V _{SS}	V _{IO}	-0.3 to V _{DDQ} +0.3	V
Power Dissipation	P _D	2.2	W
Storage Temperature	T _{STG}	-65 to 150	°C
Operating Temperature	Commercial	T _{OPR}	0 to 70
	Industrial	T _{OPR}	-40 to 85
Storage Temperature Range Under Bias	T _{BIAS}	-10 to 85	°C

*Note : Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

OPERATING CONDITIONS at 3.3V I/O (0°C ≤ T_A ≤ 70°C)

PARAMETER	SYMBOL	MIN	Typ.	MAX	UNIT

ZZ Low to Power Up	tPUS	2	-	cycle

- Notes :**
- The above parameters are also guaranteed at industrial temperature range.
 - All address inputs must meet the specified setup and hold times for all rising clock edges whenever \overline{ADSC} and/or \overline{ADSP} is sampled low and \overline{CS} is sampled low. All other synchronous inputs must meet the specified setup and hold times whenever this device is chip selected.
 - Both chip selects must be active whenever \overline{ADSC} or \overline{ADSP} is sampled low in order for the this device to remain enabled.
 - \overline{ADSC} or \overline{ADSP} must not be asserted for at least 2 Clock after leaving ZZ state.
