KS0741 Specification Revision History		
Version	Content	Date
0.0	Preliminary specification (short form)	June 8, 1999
0.1	Preliminary specification (full set)	July 14, 1999
0.2	Added temporary pin number (page 5,6)	July 15, 1999
0.3	Removed HPMB, CS2 pins CS1B pin → CSB pin VoL Max.: 0.3V _{DD} → 0.2V _{DD} , VoH Min.: 0.7V _{DD} → 0.8V _{DD} (page 59)	July 30, 1999
0.4	Removed CLS, OSCCK, OSC2 pins (page 7,8) Read internal status: MF, DS ID is added, ADC is removed (Page 35, 39) RESET flag: 0: display ON, 1: display OFF → 0: display OFF, 1: display ON (Page 39)	Aug. 12, 1999
0.5	Changed input pin order, add RESETB pin (page 5) Added VR, VEXT pin connection (page 8) VR: When using internal resistors (INTRS = "H"), open this pin VEXT: When using internal voltage regulator, connect to VDD, VSS or open this pin Added test pin connection (page 9) TEST1,TEST2: connect to "VDD" TEST3,TEST4,TEST5: connect to "VSS" Changed OSC resistance connection (page8, 23) Between OSC1 and OSC2 → between OSC1 and VDD	Aug. 30, 1999
0.6	Removed TEST2, TEST3, TEST4, TEST5, TEST6, TEST7 pins Added COMS, COMS1 for ICON display. Added ICON control register ON/OFF instruction.	Sep. 30, 1999
0.7	Remove COMS, COMS1 for ICON display. Remove ICON control register ON/OFF instruction.	Oct. 4, 1999
1.0	Added COMS, COMS1 for ICON display. Added ICON control register ON/OFF instruction. Modified bit settings for partial display command. Relaxed V _{IH} and V _{IL} specifications. Modified interface timing specs.	Jan. 18, 2000
1.1	Added 6800-mode interface description for data latch with (page 14) C2 CAP value : 0.1 to 0.47uF → 0.47 to 2.0uF (page 34) Added Icon Mode Disabled to the Reset default list. (page 36) Added description of the column address operation. (page 40) Added that Display On/Off command has priority over Entire Display On/Off and Reverse Display On/Off. (page 44) Added N-line inversion command description (page 47) The lower limit of V _{OUT} , V ₀ - V ₄ : +0.3V → -0.3V (page 60)	Jan. 24, 2000
1.2	The upper limit of V ₁ - V ₄ : V ₀ → V ₀ + 0.3V (page 60)	Feb. 8, 2000

INTRODUCTION

The KS0741 is a driver & controller LSI for 4-level gray scale graphic dot-matrix liquid crystal display systems. It contains 128 segment and 129 common driver circuits. This chip is connected directly to a microprocessor, accepts Serial Peripheral Interface(SPI) or 8-bit parallel display data and stores in an on-chip display data RAM of 128 x 129 x 2 bits. It performs display data RAM read/write operation with no external operating clock to minimize power consumption. In addition, because it contains power supply circuits necessary to drive liquid crystal, it is possible to make a display system with the fewest components.

FEATURES

4-level (White, Light Gray, Dark Gray, Black) Gray Scale Display with PWM and FRC Methods

DDRAM data [2n: 2n+1]	00	01	10	11
Gray scale	White	Light gray	Dark gray	Dark

(Accessible column address, n = 0, 1, 2,, 125, 126, 127)

Driver Output Circuits

- 128 segment outputs / 129 common outputs

Applicable Duty Ratios

Duty ratio	Applicable LCD bias	Maximum display area
1/16 ~ 1/128 (ICON disabled) 1/17 ~ 1/129 (ICON enabled)	1/5 to 1/12	129 × 128

- Various partial display
- Partial window moving & data scrolling

On-chip Display Data RAM

- Capacity: 129 × 128 × 2 = 33,024bits
- Bit data "1": a dot of display is illuminated.
- Bit data "0": a dot of display is not illuminated.

Microprocessor Interface

- 8-bit parallel bi-directional interface with 6800-series or 8080-series
- SPI (serial peripheral interface) available (only write operation)

On-chip Low Power Analog Circuit

- On-chip oscillator circuit
- Voltage converter (x3, x4, x5 or x6)
- Voltage regulator (temperature coefficient: -0.05%/°C, or external input)
- On-chip electronic contrast control function (64 steps)
- Voltage follower (LCD bias : 1/5 to 1/12)

Operating Voltage Range

- Supply voltage (V_{DD}): 1.8 to 3.3V
- LCD driving voltage (V_{LCD} = V_O - V_{SS}): 4.0 to 15.0 V

Low Power Consumption

- TBD μ A Max. (operation)
- TBD μ A Max. (sleep mode)

Package Type

- Slim chip for TCP

1/N bias	$(N-1) / N \times V0$	$(N-2) / N \times V0$	$(2/N) \times V0$	$(1/N) \times V0$								

LCD DRIVER SUPPLY

Table 4. LCD Driver Supply Pin Description

Name	I/O	Description
C1-	O	Capacitor 1 negative connection pin for voltage converter
C1+	O	Capacitor 1 positive connection pin for voltage converter
C2-	O	Capacitor 2 negative connection pin for voltage converter
C2+	O	Capacitor 2 positive connection pin for voltage converter
C3+	O	Capacitor 3 positive connection pin for voltage converter
C4+	O	Capacitor 4 positive connection pin for voltage converter
C5+	O	Capacitor 5 positive connection pin for voltage converter
VOUT	I/O	Voltage converter input / output pin
VCI	I	Voltage converter input voltage pin
VR	I	V0 voltage adjustment pin It is valid only when on-chip resistors are not used (INTRS = "L") When using internal resistors (INTRS = "H"), open this pin
REF	I	Selects the external VREF voltage via the VEXT pin – REF = "H": using the internal VREF – REF = "L": using the external VREF
VEXT	I	Externally input reference voltage (VREF) for the internal voltage regulator It is valid only when REF is "L" When using internal voltage regulator, connect to VDD, VSS or open this pin
OSC1	I	When using internal clock oscillator, connect a resistor between OSC1 and VDD.

SYSTEM CONTROL**Table 5. System Control Pin Description**

Name	I/O	Description
INTRS	I	Internal resistor select pin This pin selects the resistors for adjusting V0 voltage level – INTRS = "H": use the internal resistors. – INTRS = "L": use the external resistors VR pin and external resistive divider control V0 voltage
TEST1	O	Test pins Don't use this pin. – TEST1: Open this pin.

MICROPROCESSOR INTERFACE

Table 6. Microprocessor Interface Pin Description

Name	I/O	Description					
RESETB	I	Reset input pin When RESETB is "L", initialization is executed.					
PS0	I	Parallel / Serial data input select input					
		PS0	Interface mode	Data / instruction	Data	Read / Write	Serial clock
		H	Parallel	RS	DB0 to DB7	E_RD RW_WR	-
		L	Serial	RS or None	SID (DB7)	Write only	SCLK (DB6)
*NOTE: In serial mode, it is impossible to read data from the on-chip RAM. And DB0 to DB5 are high impedance and E_RD and RW_WR must be fixed to either "H" or "L".							
PS1	I	Microprocessor interface select input pin <ul style="list-style-type: none"> - PS0 = "H" , PS1 = "H": 6800-series parallel MPU interface - PS0 = "H" , PS1 = "L": 8080-series parallel MPU interface - PS0 = "L" , PS1 = "H": 4 pin-SPI MPU interface - PS0 = "L" , PS1 = "L": 3 pin-SPI MPU interface 					
CSB	I	Chip select input pins Data/instruction I/O is enabled only when CSB is "L". When chip select is non-active, DB0 to DB7 may be high impedance.					
RS	I	Register select input pin <ul style="list-style-type: none"> - RS = "H": DB0 to DB7 are display data - RS = "L": DB0 to DB7 are control data 					
RW_WR	I	Read / Write execution control pin					
		C68	MPU type	RW_WR	Description		
		H	6800-series	RW	Read / Write control input pin <ul style="list-style-type: none"> - RW = "H" : read - RW = "L" : write 		
		L	8080-series	/WR	Write enable clock input pin The data on DB0 to DB7 are latched at the rising edge of the /WR signal.		

Table 7. Microprocessor Interface Pin Description (Continued)

Name	I/O	Description			
E_RD	I	Read / Write execution control pin			
		PS1	MPU Type	E_RD	Description
		H	6800-series	E	Read / Write control input pin – RW = "H": When E is "H", DB0 to DB7 are in an output status. – RW = "L": The data on DB0 to DB7 are latched at the falling edge of the E signal.
		L	8080-series	/RD	Read enable clock input pin When /RD is "L", DB0 to DB7 are in an output status.
DB0 to DB7	I/O	8-bit bi-directional data bus that is connected to the standard 8-bit microprocessor data bus. When the serial interface selected (PS0 = "L"); – DB0 to DB5: high impedance – DB6: serial input clock (SCLK) – DB7: serial input data (SID) When chip select is not active, DB0 to DB7 may be high impedance.			

LCD DRIVER OUTPUTS

Table 8. LCD Driver Output Pin Description

Name	I/O	Description			
SEG0 to SEG127	O	LCD segment driver outputs The display data and the M signal control the output voltage of segment driver.			
		Display data	M (Internal)	Segment driver output voltage	
				Normal display	Reverse display
		H	H	V0	V2
		H	L	VSS	V3
		L	H	V2	V0
		L	L	V3	VSS
		Power save mode		VSS	VSS
COM0 to COM127	O	LCD common driver outputs The internal scanning data and M signal control the output voltage of common driver.			
		Scan data	M (Internal)	Common driver output voltage	
				VSS	
		H	H	V0	
		H	L	V1	
		L	H	V4	
		L	L	VSS	
Power save mode		VSS			
COMS (COMS1)	O	Common output for the icons The output signals of two pins are same. When not used, these pins should be left open.			

NOTE: DUMMY – These pins should be opened (floated).

FUNCTIONAL DESCRIPTION

MICROPROCESSOR INTERFACE

Chip Select Input

There is CSB pin for chip selection. The KS0741 can interface with an MPU when CSB is "L". When these pins are set to any other combination, RS, E_RD, and RW_WR inputs are disabled and DB0 to DB7 are to be high impedance. And, in case of serial interface, the internal shift register and the counter are reset.

Parallel / Serial Interface

KS0741 has four types of interface with an MPU, which are two serial and two parallel interfaces. This parallel or serial interface is determined by PS pin as shown in table 9.

Table 9. Parallel / Serial Interface Mode

Type	PS1	CSB	PS0	Interface mode
Parallel	H	CSB	H	6800-series MPU mode
	L			8080-series MPU mode
Serial	H	CSB	L	4-pin SPI mode
	L			3-pin SPI mode

Parallel Interface (PS0 = "H")

The 8-bit bi-directional data bus is used in parallel interface and the type of MPU is selected by PS1 as shown in table 10. The type of data transfer is determined by signals at RS, E_RD and RW_WR as shown in table 11.

Table 10. Microprocessor Selection for Parallel Interface

PS1	CSB	RS	E_RD	RW_WR	DB0 to DB7	MPU bus
H	CSB	RS	E	RW	DB0 to DB7	6800-series
L	CSB	RS	/RD	/WR	DB0 to DB7	8080-series

Table 11. Parallel Data Transfer

Common	6800-series		8080-series		Description
	E_RD (E)	RW_WR (RW)	E_RD (/RD)	RW_WR (/WR)	
RS					
H	H	H	L	H	Display data read out
H	H	L	H	L	Display data write
L	H	H	L	H	Register status read
L	H	L	H	L	Writes to internal register (instruction)

NOTE: When E_RD pin is always pulled high for 6800-series interface, it can be used CSB for enable signal. In this case, interface data is latched at the rising edge of CSB and the type of data transfer is determined by signals at RS, RW_WR as in case of 6800-series mode.

Serial Interface (PS0 = "L")

When the KS0741 is active(CSB="L"), serial data (DB7) and serial clock (DB6) inputs are enabled. And not active, the internal 8-bit shift register and the 3-bit counter are reset. The display data/command indication may be controlled either via software or the Register Select(RS) Pin, based on the setting of PS1. When the RS pin is used (PS1 = "H"), data is display data when RS is high, and command data when RS is low. When RS is not used (PS1 = "L"), the LCD Driver will receive command from MCU by default. If messages on the data pin are data rather than command, MCU should send Data Direction command(11101000) to control the data direction and then one more command to define the number of data bytes will be write. After these two continuous commands are send, the following messages will be data rather than command. Serial data can be read on the rising edge of serial clock going into DB6 and processed as 8-bit parallel data on the eighth serial clock. And the DDRAM column address pointer will be increased by one automatically. The next bytes after the display data string is handled as command data.

Serial Mode	PS0	PS1	CSB	RS
4-Pin SPI mode	L	H	CSB	Used
3-Pin SPI mode	L	L	CSB	Not used

4-pin SPI mode (PS0 = "L" , PS1 = "H")

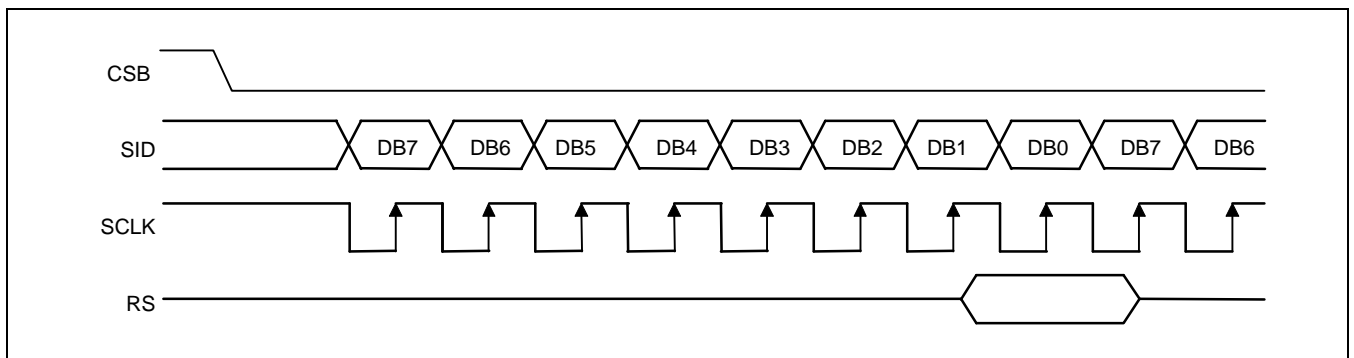

Figure 3. 4-pin SPI Timing (RS is used)

3-pin SPI mode (PS0 = "L" , PS1 = "L")

To write data to the DDRAM, send Data Direction Command in 3-pin SPI mode. Data is latched at the rising edge of SCLK. And the DDRAM column address pointer will be increased by one automatically.

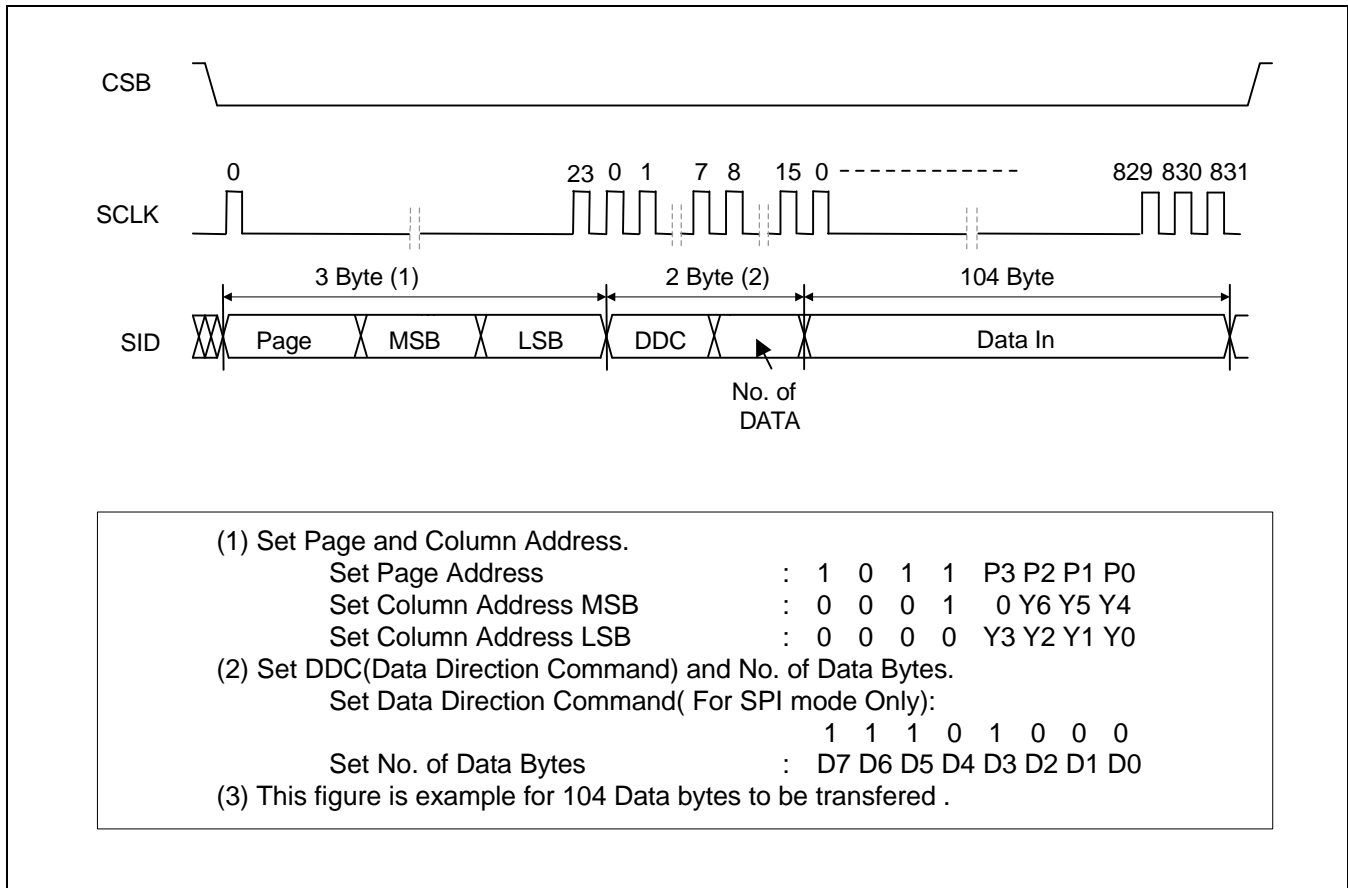

Figure 4. 3-pin SPI Timing (RS is not used)

This command is used in 3-pin SPI mode only. It will be two continuous commands, the first byte controls the data direction and informs the LCD driver the second byte will be number of data bytes will be write. After these two commands sending out, the following messages will be data. If data is stopped in transmitting, it is not valid data. New data will be transferred serially with most significant bit first.

NOTE: In spite of transmission of data, if CSB will be disable, state terminates abnormally. Next state is initialized.

Busy Flag

The Busy Flag indicates whether the KS0741 is operating or not. When DB7 is "H" in read status operation, this device is in busy status and will accept only read status instruction. If the cycle time is correct, the microprocessor needs not to check this flag before each instruction, which improves the MPU performance.

Data Transfer

The KS0741 uses bus holder and internal data bus for data transfer with the MPU. When writing data from the MPU to on-chip RAM, data is automatically transferred from the bus holder to the RAM as shown in figure 5. And when reading data from on-chip RAM to the MPU, the data for the initial read cycle is stored in the bus holder (dummy read) and the MPU reads this stored data from bus holder for the next data read cycle as shown in figure 6. This means that a dummy read cycle must be inserted between each pair of address sets when a sequence of address sets is executed. Therefore, the data of the specified address cannot be output with the read display data instruction right after the address sets, but can be output at the second read of data.

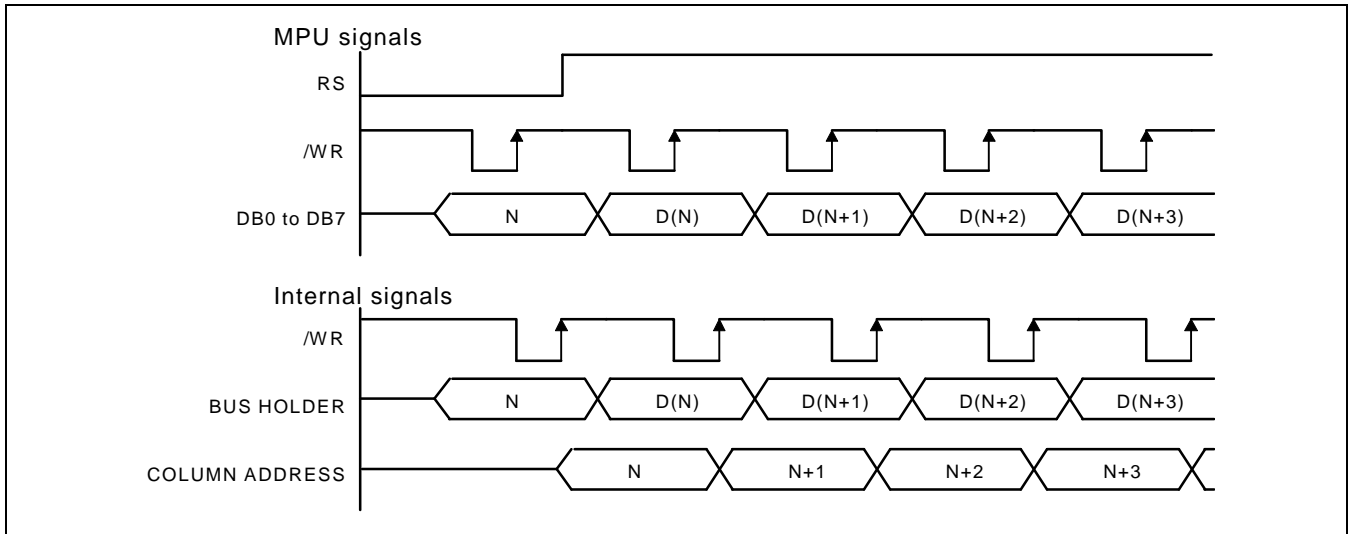

Figure 5. Write Timing

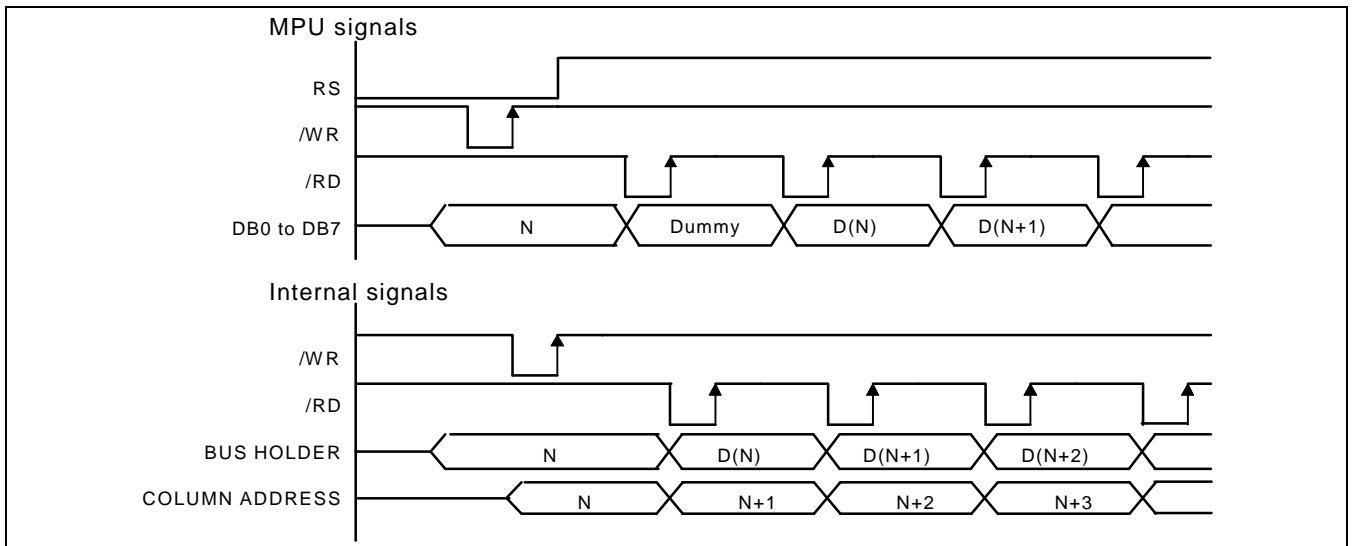

Figure 6. Read Timing

DISPLAY DATA RAM (DDRAM)

The Display Data RAM stores pixel data for the LCD. It is 129-row (17 page by 8 bits) by 128-column addressable array. Each pixel can be selected when the page and column addresses are specified. The 129 rows are divided into 16 pages of 8 lines and the 17th page with a single line (DB0 only). Data is read from or written to the 8 lines of each page directly through DB0 to DB7. The display data of DB0 to DB7 from the microprocessor correspond to the LCD common lines. The microprocessor can read from and write to RAM through the I/O buffer. Since the LCD controller operates independently, data can be written into RAM at the same time as data is being displayed without causing the LCD flicker.

Page Address Circuit

This circuit is for providing a Page Address to Display Data RAM shown in figure 8. It incorporates 4-bit Page Address register changed by only the "Set Page" instruction. Page Address 16 is a special RAM area for the icons and display data DB0 is only valid.

Line Address Circuit

This circuit assigns DDRAM a Line Address corresponding to the first line (COM0) of the display. Therefore, by setting Line Address repeatedly, it is possible to realize the screen scrolling and page switching without changing the contents of on-chip RAM as shown in figure 8. It incorporates 7-bit Line Address register changed by only the initial display line instruction and 7-bit counter circuit. At the beginning of each LCD frame, the contents of register are copied to the line counter which is increased by CL signal and generates the line address for transferring the 128-bit RAM data to the display data latch circuit. When icon is enabled by setting icon control register, display data of icons are not scrolled because the MPU can not access Line Address of icons.

Column Address Circuit

Column Address Circuit has a 8-bit preset counter that provides Column Address to the Display Data RAM as shown in figure 8. When set Column Address MSB / LSB instruction is issued, 7-bit [Y7:Y1] are set and lowest bit, Y0 is set to "0". Since this address is increased by 1 each a read or write data instruction, microprocessor can access the display data continuously. However, the counter is not increased and locked if a non-existing address above 7EH. It is unlocked if a column address is set again by set Column Address MSB / LSB instruction. And the column address counter is independent of page address register.

ADC select instruction makes it possible to invert the relationship between the Column Address and the segment outputs. It is necessary to rewrite the display data on built-in RAM after issuing ADC select instruction. Refer to the following figure 7.

SEG output	SEG 0		SEG 1		SEG 2		SEG 3		...	SEG 124		SEG 125		SEG 126		SEG 127	
Column address [Y7:Y1]	00H		01H		02H		03H		...	7CH		7DH		7EH		7FH	
Internal column address [Y7:Y0]	00 HEX	01 HEX	02 HEX	03 HEX	04 HEX	05 HEX	06 HEX	07 HEX	...	F8 HEX	F9 HEX	FA HEX	FB HEX	FC HEX	FD HEX	FE HEX	FF HEX

LCD panel display	[Light]		[Light]		[Dark]		[Dark]		...	[Light]		[Light]		[Dark]		[Dark]	

Figure 7. The Relationship between the Column Address and The Segment Outputs

Segment Control Circuit

This circuit controls the display data by the display ON / OFF, reverse display ON / OFF and entire display ON / OFF instructions without changing the data in the display data RAM.

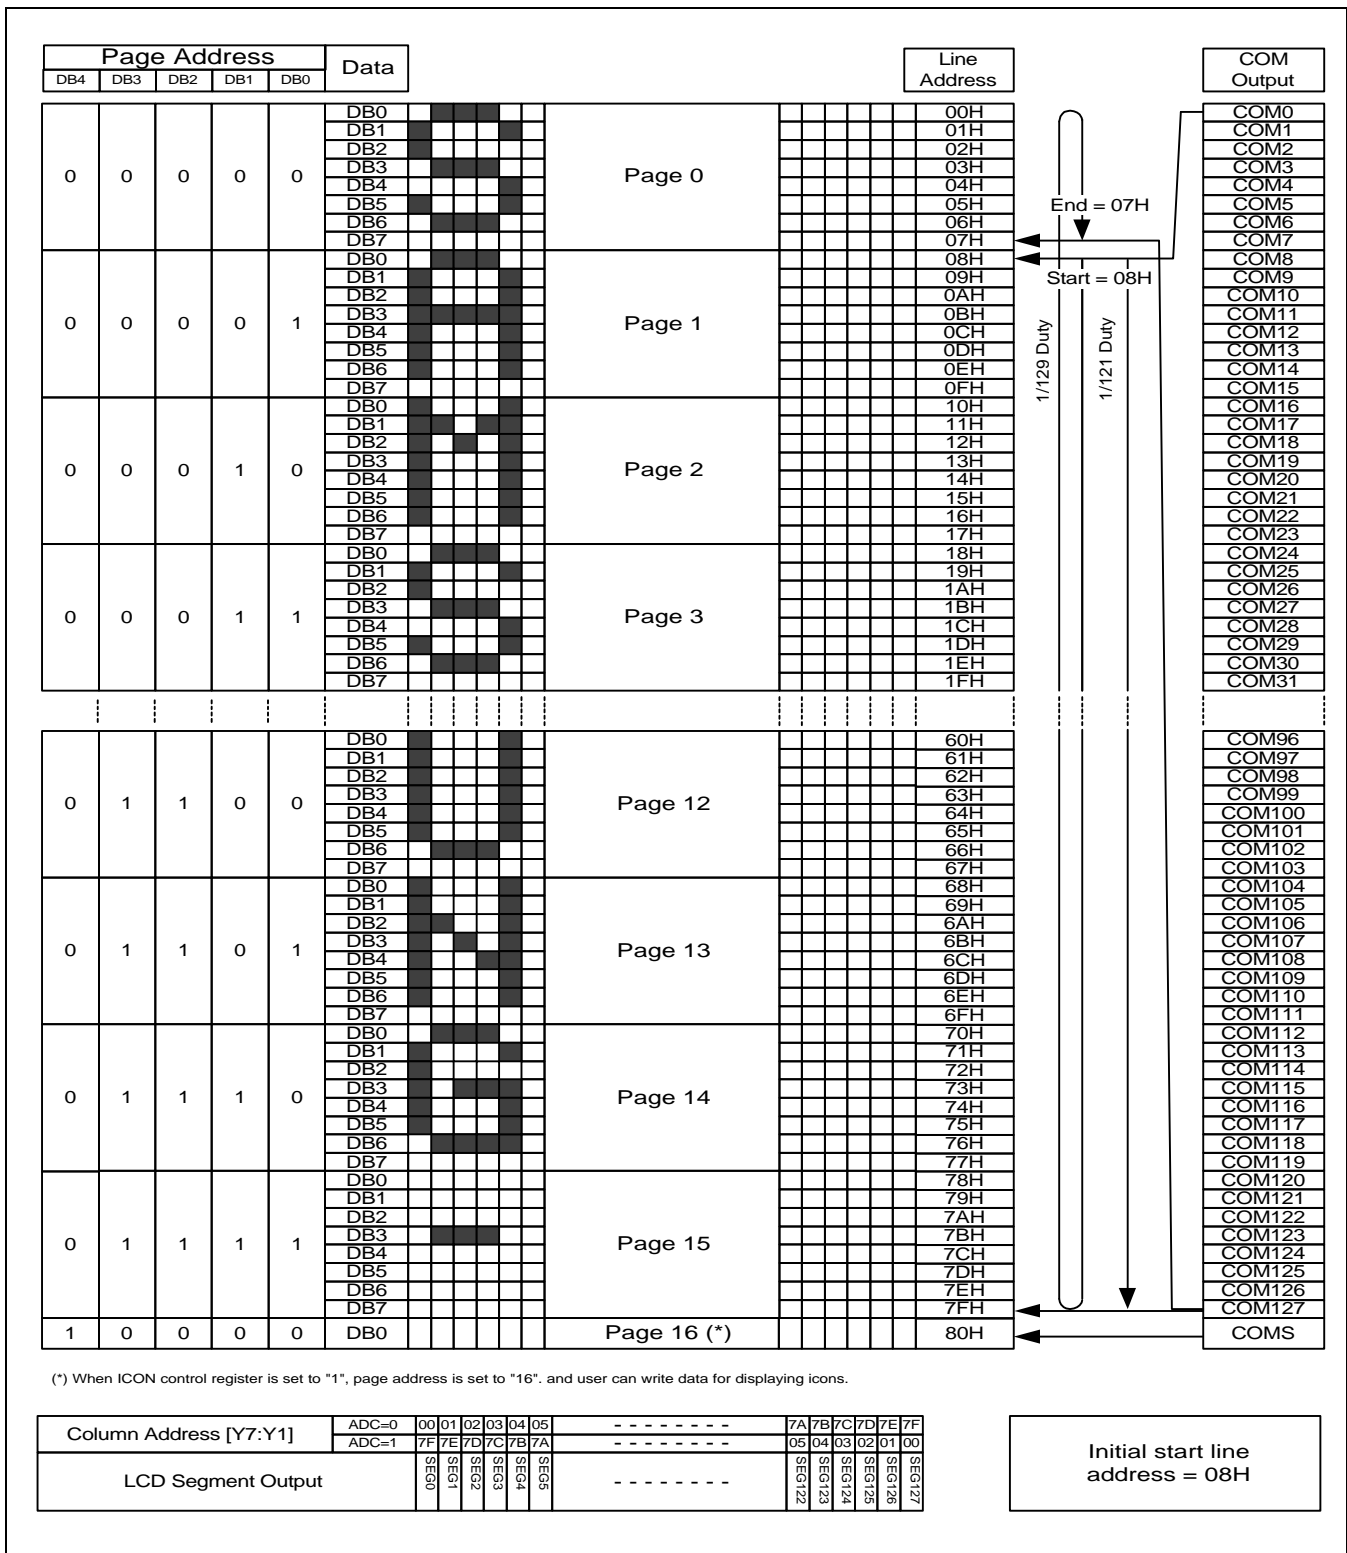

Figure 8. Display Data RAM Map

LCD DISPLAY CIRCUITS

FRC (Frame Rate Control) and PWM (Pulse Width Modulation) Function Circuit

The KS0741 incorporates an FRC function and a PWM function circuit to display a 4-level gray scale. The FRC function and PWM utilize liquid crystal characteristics whose transmittance is changed by an effective value of applied voltage. The KS0741 provides four 4-bit palette-registers to assign the desired gray level. These registers are set by the instructions and the RESETB.

– Gray Scale Table of 4 FRC (Frame Rate Control)

Gray scale level	MSB (DB7 to DB4)	LSB (DB3 to DB0)
White	2nd FR (FR2)	1st FR (FR1)
	4th FR (FR4)	3rd FR (FR3)
Light gray	2nd FR (FR2)	1st FR (FR1)
	4th FR (FR4)	3rd FR (FR3)
Dark gray	2nd FR (FR2)	1st FR (FR1)
	4th FR (FR4)	3rd FR (FR3)
Black	2nd FR (FR2)	1st FR (FR1)
	4th FR (FR4)	3rd FR (FR3)

– Gray Scale Table of 3 FRC (Frame Rate Control)

Gray scale level	MSB (DB7 to DB4)	LSB (DB3 to DB0)

Oscillator

This is on-chip Oscillator with external resistor. Its frequency is controlled by external resistor between OSC1 and VDD. This oscillator signal is used in the voltage converter and display timing generation circuit.

Display Timing Generator Circuit

This circuit generates some signals to be used for displaying LCD. The display clock, CL(internal), generated by oscillation clock, generates the clock for the line counter and the signal for the display data latch. The line address of on-chip RAM is generated in synchronization with the display clock and the display data latch circuit latches the 128-bit display data in synchronization with the display clock. The display data, which is read to the LCD driver, is completely independent of the access to the display data RAM from the microprocessor. The display clock generates an LCD AC signal (M) which enables the LCD driver to make a AC drive waveform, and also generates an internal common timing signal and start signal to the common driver. The frame signal or the line signal changes the M by setting internal instruction. Driving waveform and internal timing signal are shown in Figure 9.

Figure 9. 2-frame AC Driving Waveform (Duty Ratio = 1/128)

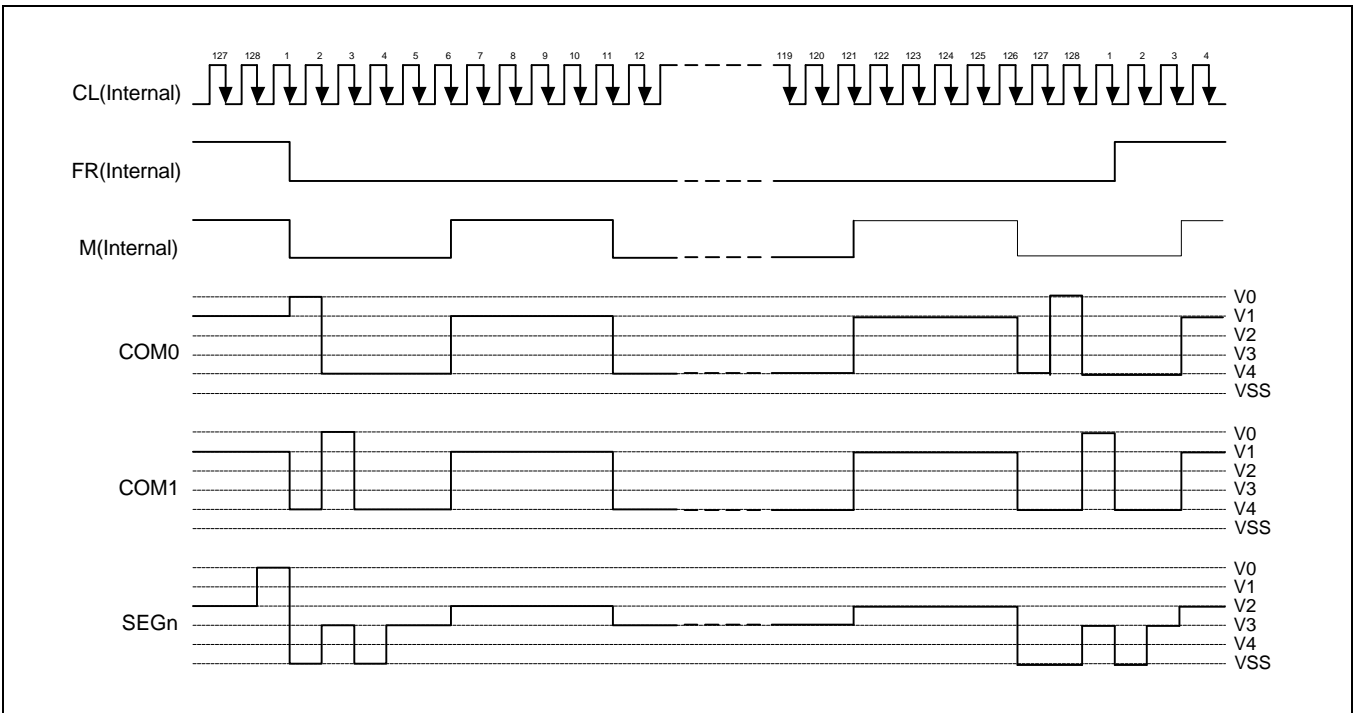

Figure 10. N-Line Inversion Driving Waveform (N = 5, Duty Ratio = 1/128)

LCD DRIVER CIRCUIT

This driver circuit is configured by 129-channel common drivers and 128-channel segment drivers. This LCD panel driver voltage depends on the combination of display data and M signal.

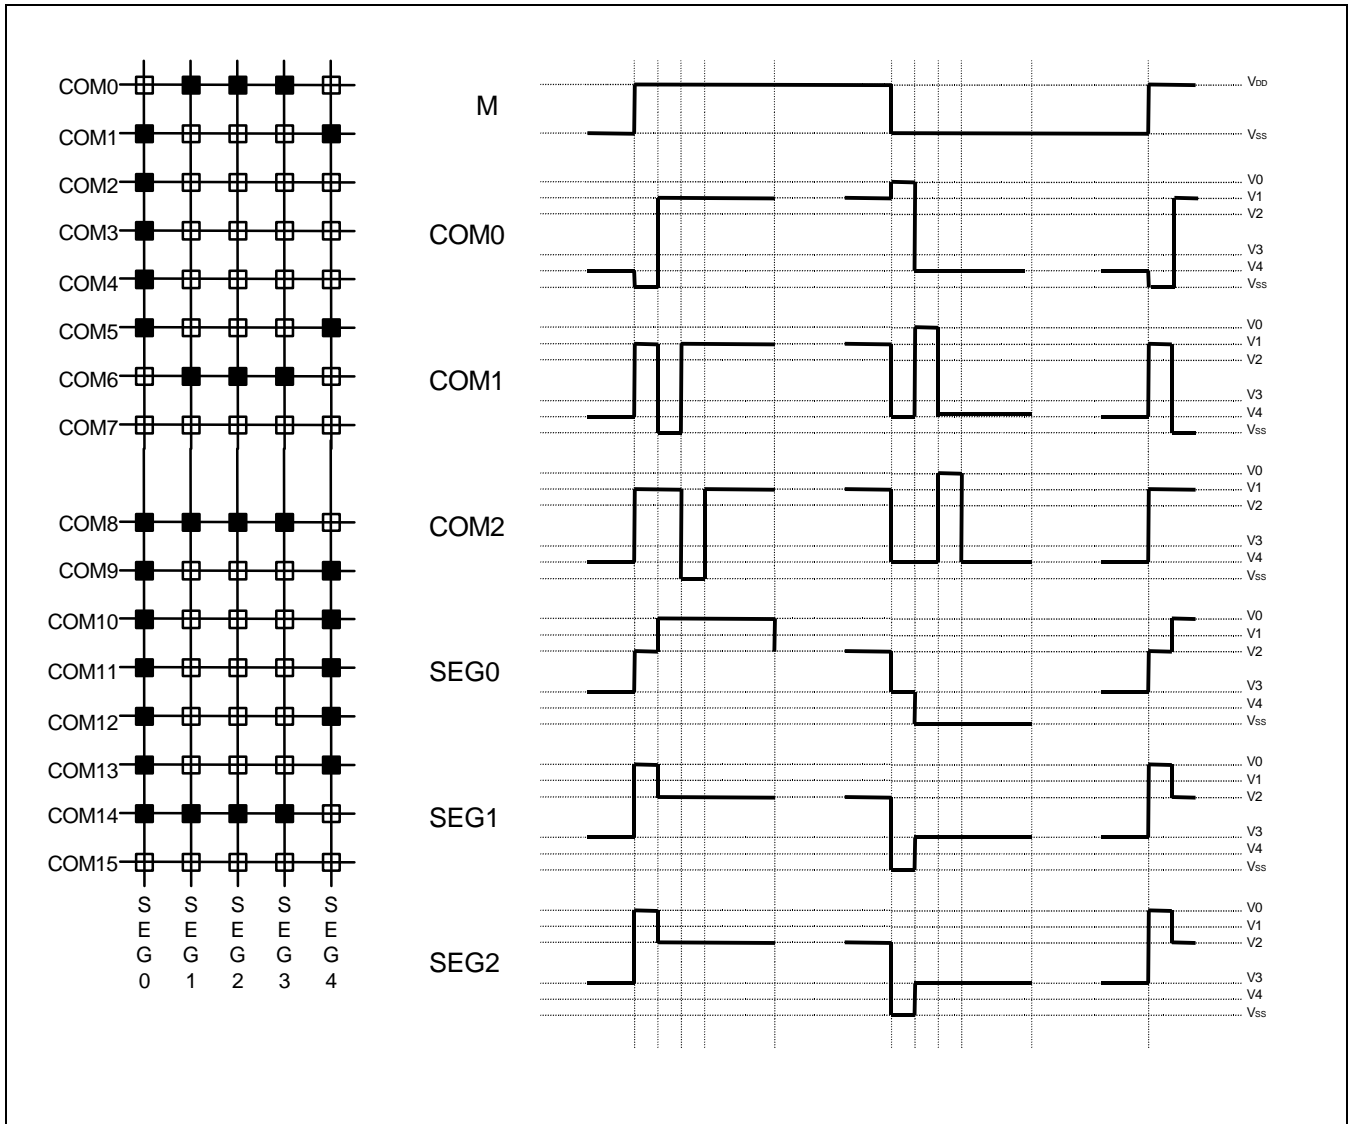

Figure 11. Segment and Common Timing

Partial Display on LCD

The KS0741 realizes the Partial Display function on LCD with low-duty driving for saving power consumption and showing the various display duty. To show the various display duty on LCD, LCD driving duty and bias are programmable via the instruction. And, built-in power supply circuits are controlled by the instruction for adjusting the LCD driving voltages

Figure 12. Reference Example for Partial Display

Figure 13. Partial Display (Partial Display Duty = 16, Initial COM0 = 0)

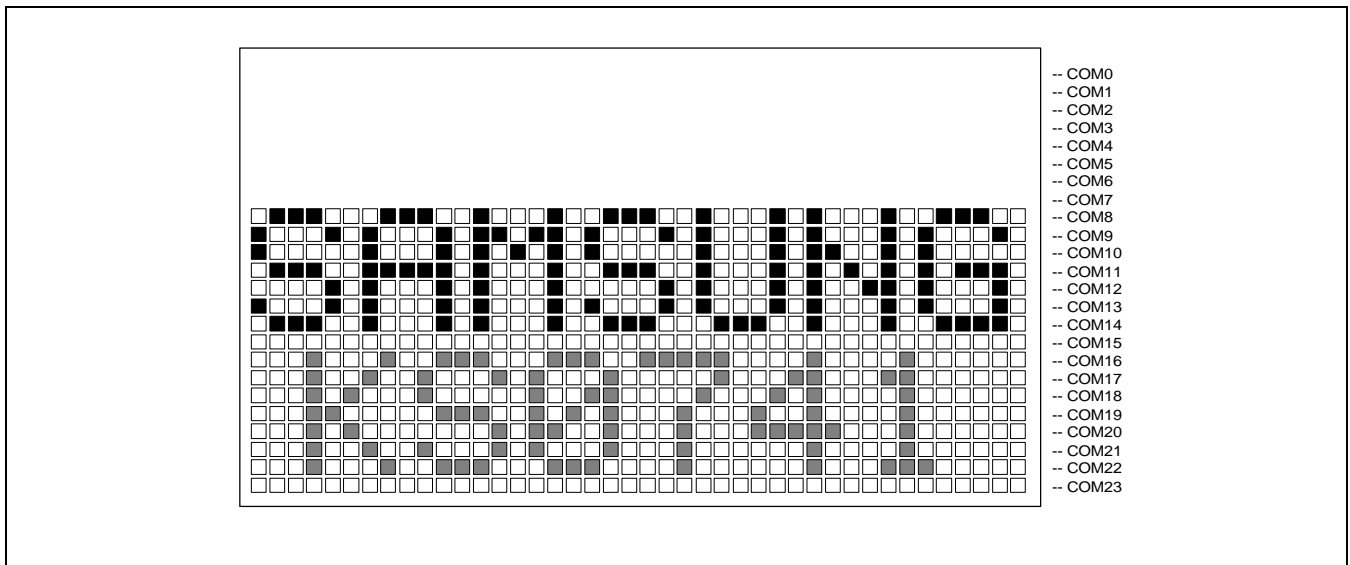

Figure 14. Moving Display (Partial Display Duty = 16, Initial COM0 = 8)

POWER SUPPLY CIRCUITS

The Power Supply circuits generate the voltage levels necessary to drive liquid crystal driver circuits with low power consumption and the fewest components. There are voltage converter circuits, voltage regulator circuits, and voltage follower circuits. They are controlled by power control instruction. For details, refers to "Instruction Description". Table 12 shows the referenced combinations in using Power Supply circuits.

Table 12. Recommended Power Supply Combinations

User setup	Power control (VC VR VF)	V/C circuits	V/R circuits	V/F circuits	VOUT	V0	V1 to V4
Only the internal power supply circuits are used	1 1 1	ON	ON	ON	Open	Open	Open
Only the voltage regulator circuits and voltage follower circuits are used	0 1 1	OFF	ON	ON	External input	Open	Open
Only the voltage follower circuits are used	0 0 1	OFF	OFF	ON	Open	External input	Open
Only the external power supply circuits are used	0 0 0	OFF	OFF	OFF	Open	External input	External input

Voltage Converter Circuits

These circuits boost up the electric potential between VCI and Vss to 3, 4, 5 or 6 times toward positive side and boosted voltage is outputted from VOUT pin. It is possible to select the lower boosting level in any boosting circuit by "Set DC-DC Step-up" instruction. When the higher level is selected by instruction, VOUT voltage is not valid.

[C1 = 1.0 to 4.7 nF]

Figure 15. Three Times Boosting Circuit

Figure 16. Four Times Boosting Circuit

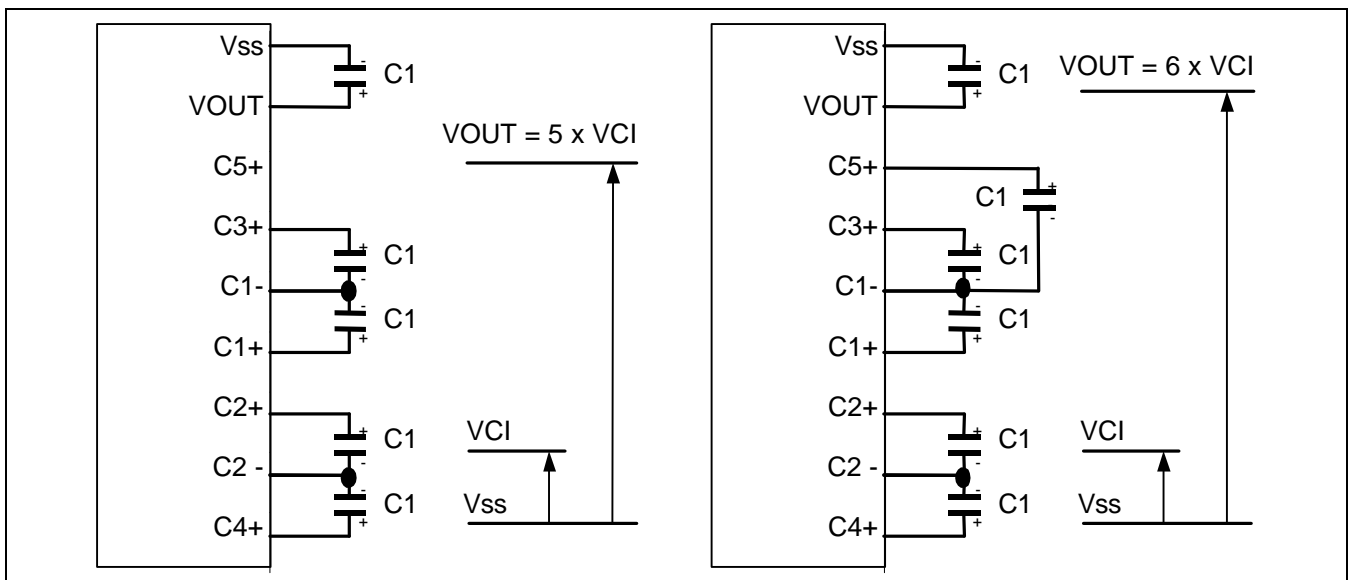

Figure 17. Five Times Boosting Circuit

Figure 18. Six Times Boosting Circuit

Voltage Regulator Circuits

The function of the internal Voltage Regulator circuits is to determine liquid crystal operating voltage, V₀, by adjusting resistors, R_a and R_b, within the range of |V₀| < |V_{OUT}|. Because V_{OUT} is the operating voltage of operational-amplifier circuits shown in figure 19, it is necessary to be applied internally or externally.

For the Eq. 1, we determine V₀ by R_a, R_b and V_{EV}. The R_a and R_b are connected internally or externally by INTRS pin. And V_{EV} called the voltage of electronic volume is determined by Eq. 2, where the parameter α is the value selected by instruction, "Set Reference Voltage Register", within the range 0 to 63. V_{REF} voltage at T_a= 25°C is shown in Table 13.

$$V_0 = \left(1 + \frac{R_b}{R_a}\right) \times V_{EV} \text{ [V] ----- (Eq. 1)}$$

$$V_{EV} = \left(1 - \frac{(63 - \alpha)}{210}\right) \times V_{REF} \text{ [V] ----- (Eq. 2)}$$

Table 13 . V_{REF} Voltage at T_a = 25°C

REF	Temp. coefficient	V _{REF} [V]
1	-0.05% / °C	2.1
0	External input	V _{EXT}

Figure 19. Internal Voltage Regulator Circuit

In Case of Using Internal Resistors, Ra and Rb (INTRS = "H")

When INTRS pin is "H", resistor Ra is connected internally between VR pin and Vss, and Rb is connected between V0 and VR. We determine V0 by two instructions, "Regulator Resistor Select" and "Set Reference Voltage".

Table 14. Internal Rb / Ra Ratio depending on 3-bit Data (R2 R1 R0)

	3-bit data settings (R2 R1 R0)							
	0 0 0	0 0 1	0 1 0	0 1 1	1 0 0	1 0 1	1 1 0	1 1 1
1 + (Rb / Ra)	2.3	3.0	3.7	4.4	5.1	5.8	6.5	7.2

Figure 20 Shows V0 voltage measured by adjusting internal regulator register ratio (Rb / Ra) and 6-bit electronic volume registers for each temperature coefficient at Ta = 25 °C.

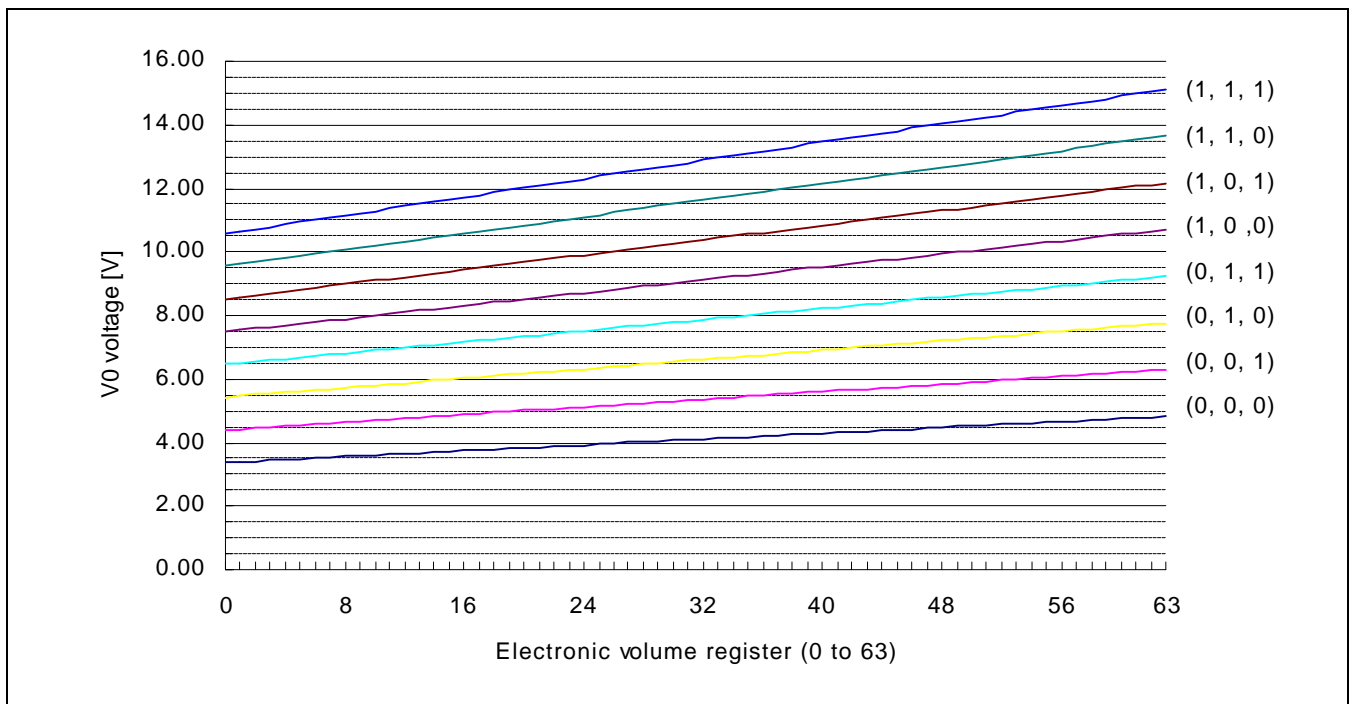

Figure 20. Electronic Volume Level (Temp. Coefficient = -0.05% / °C)

In Case of Using External Resistors, Ra and Rb (INTRS = "L")

When INTRS pin is "L", it is necessary to connect external regulator resistor Ra between VR and VSS, and Rb between V0 and VR.

Example: For the following requirements

1. LCD driver voltage, V0 = 10V
2. 6-bit reference voltage register = (1, 0, 0, 0, 0, 0)
3. Maximum current flowing Ra, Rb = 1 uA

From Eq. 1

$$10 = \left(1 + \frac{R_b}{R_a}\right) \times V_{EV} \text{ [V] ----- (Eq. 3)}$$

From Eq. 1

$$V_{EV} = \left(1 - \frac{(63 - 32)}{210}\right) \times 2.1 = 1.79 \text{ [V] ----- (Eq. 4)}$$

From requirement 3.

$$\frac{10}{R_a + R_b} = 1 \text{ [uA] ----- (Eq. 5)}$$

From equations Eq. 3, 4 and 5

$$R_a = 1.79 \text{ [M}\Omega\text{]}$$

$$R_b = 8.21 \text{ [M}\Omega\text{]}$$

Table 15 Shows the Range of V0 depending on the above Requirements.

Table 15. The Range of V0

	Electronic volume level				
	0	32	63
V0	8.21	10.00	11.73

Voltage Follower Circuits

VLCD voltage (V0) is resistively divided into four voltage levels (V1, V2, V3 and V4), and those output impedance are converted by the Voltage Follower for increasing drive capability. Table 16 shows the relationship between V1 to V4 level and each duty ratio.

Table 16. The Relationship Between V1 to V4 Level and Each Duty Ratio

LCD bias	V1	V2	V3	V4	Remarks
1/N	(N-1)/N x V0	(N-2)/N x V0	2/N x V0	1/N x V0	N = 5 to 12

REFERENCE CIRCUIT EXAMPLES

[C1 = 1.0 to 4.7 [μF], C2 = 0.47 to 2.0 [μF]]

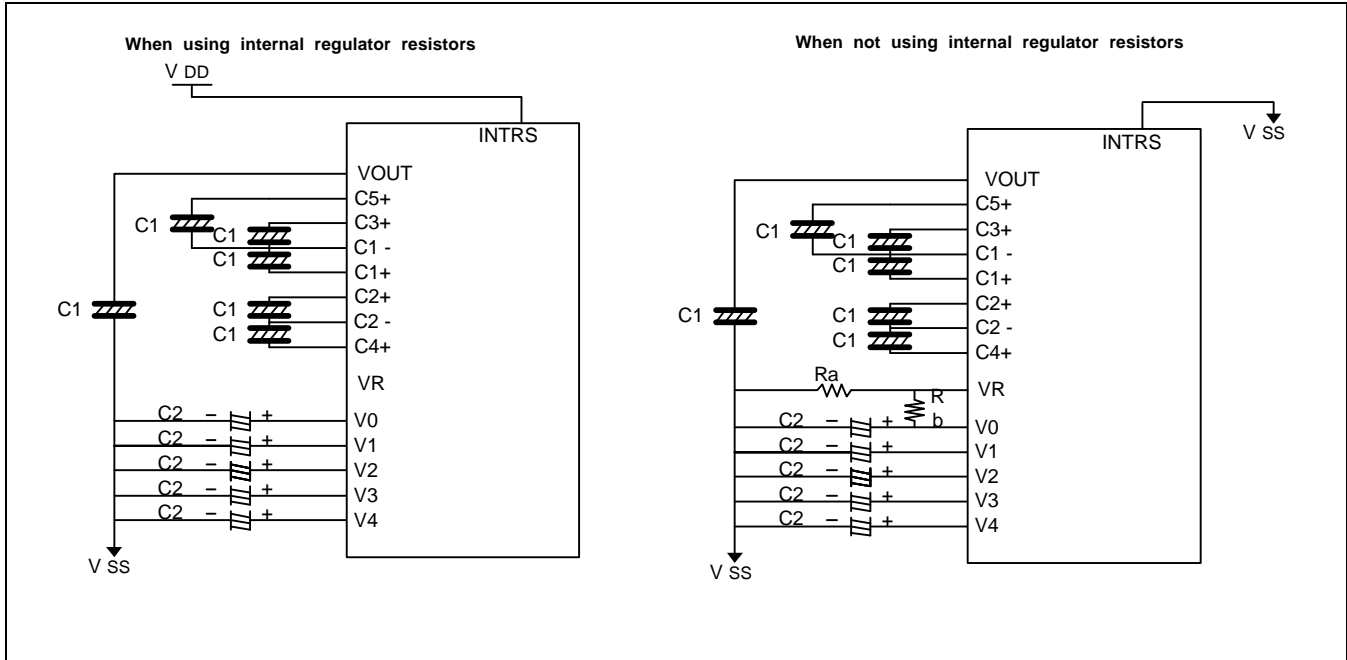

Figure 21. When Using all LCD Power Circuits (6-Time V/C: ON, V/R: ON, V/F: ON)

[C2 = 0.47 to 2.0 [μF]]

[C2 = 0.47 to 2.0 [μF]]

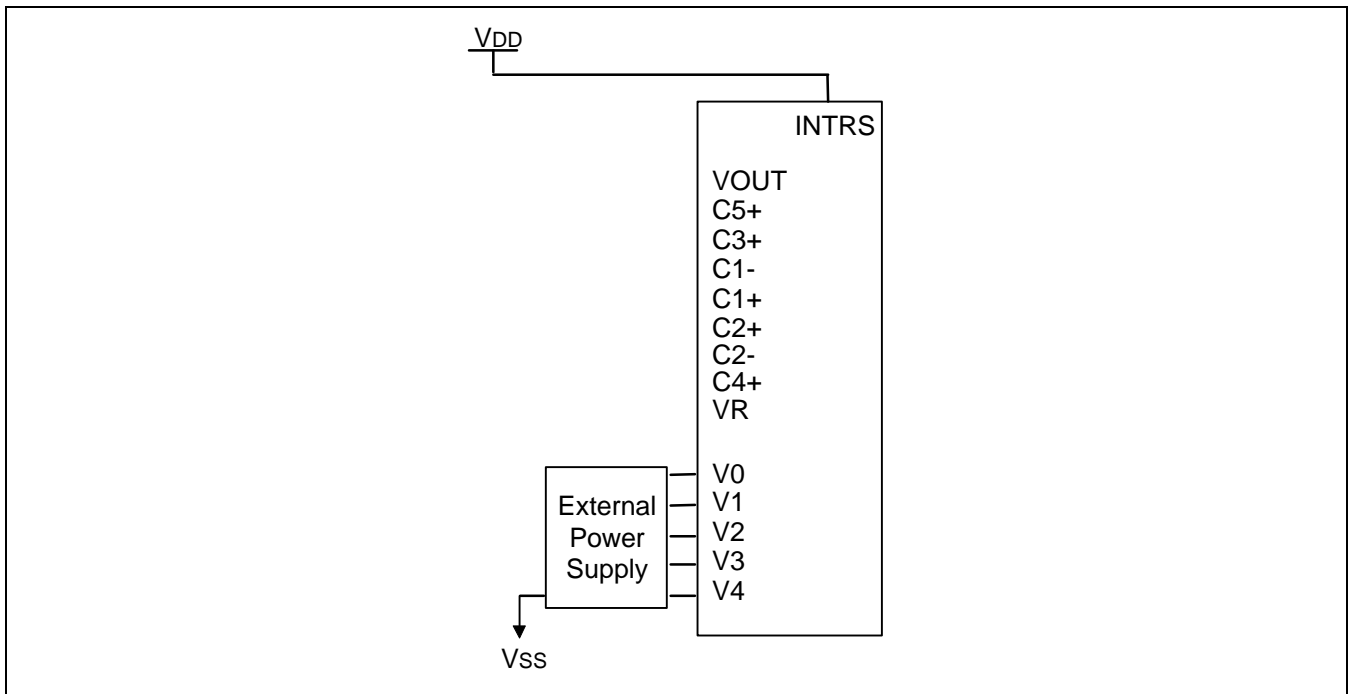

Figure 24. When Not Using any Internal LCD Power Supply Circuits (V/C: OFF, V/R: OFF, V/F: OFF)

RESET CIRCUIT

Setting RESETB to "L" or Reset instruction can initialize internal function.

When RESETB becomes "L", following procedure is occurred.

Page address: 0
 Column address: 0
 Read-modify-write: OFF
 Display ON / OFF: OFF
 Initial display line: 0 (first)
 Initial COM0 register: 0 (COM0)
 Partial display duty ratio: 1/128
 Reverse display ON / OFF: OFF (normal)
 N-line inversion register: 0 (disable)
 Entire Display ON/OFF: OFF
 ICON Control register ON/OFF: OFF (ICON disable)
 Power control register (VC, VR, VF) = (0, 0, 0)
 DC-DC converter circuit = (0, 0)
 Regulator resistor select register: (R2, R1, R0) = (0, 0, 0)
 Contrast Level: 32
 LCD bias ratio: 1/12
 COM Scan Direction: 0
 ADC Select: 0
 Oscillator: OFF
 Power Save Mode: Release
 Display Data Length register: 0 (for SPI mode)
 White mode set: OFF
 White palette register (WG3, WG2, WG1, WG0) = (0, 0, 0, 0)
 Light gray mode set: OFF
 Light gray palette register (LG3, LG2, LG1, LG0) = (0, 0, 0, 0)
 Dark gray mode set: OFF
 Dark gray palette register (DG3, DG2, DG1, DG0) = (1, 1, 1, 1)
 Black mode set: OFF
 Black palette register (BG3, BG2, BG1, BG0) = (1, 1, 1, 1)
 FRC, PWM mode: 4FRC, 9PWM

When RESET instruction is issued, following procedure is occurred.

Page address: 0
 Column address: 0
 Read-modify-write: OFF
 Initial display line: 0 (First)
 Regulator resistor select register: (R2, R1, R0) = (0, 0, 0)
 Contrast Level: 32
 Display Data Length register: 0 (for SPI mode)
 White mode set: OFF
 White palette register (WG3, WG2, WG1, WG0) = (0, 0, 0, 0)
 Light gray mode set: OFF
 Light gray palette register (LG3, LG2, LG1, LG0) = (0, 0, 0, 0)
 Dark gray mode set: OFF
 Dark gray palette register (DG3, DG2, DG1, DG0) = (1, 1, 1, 1)
 Black mode set: OFF
 Black palette register (BG3, BG2, BG1, BG0) = (1, 1, 1, 1)
 FRC, PWM mode: 4FRC, 9PWM

While RESETB is "L" or reset instruction is executed, no instruction except read status can be accepted. Reset status appears at DB4. After DB4 becomes "L", any instruction can be accepted. RESETB must be connected to the reset pin of the MPU, and initialize the MPU and this LSI at the same time. The initialization by RESETB is essential before used.

INSTRUCTION DESCRIPTION

Table 17. Instruction Table

× : Don't care

Instruction	RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	Description
Read display data	1	1	Read data								Read data from DDRAM
Write display data	1	0	Write data								Write data into DDRAM

Read Display Data

8-bit data from Display Data RAM specified by the column address and page address can be read by this instruction. As the column address is increased by 1 automatically after each this instruction, the microprocessor can continuously read data from the addressed page. A dummy read is required after loading an address into the column address register. Display Data cannot be read through the serial interface.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	1	Read data							

Write Display Data

8-bit data of Display Data from the microprocessor can be written to the RAM location specified by the column address and page address. The column address is increased by 1 automatically so that the microprocessor can continuously write data to the addressed page. During auto-increment, the column address wraps to 0 after the last column is written

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	0	Write data							

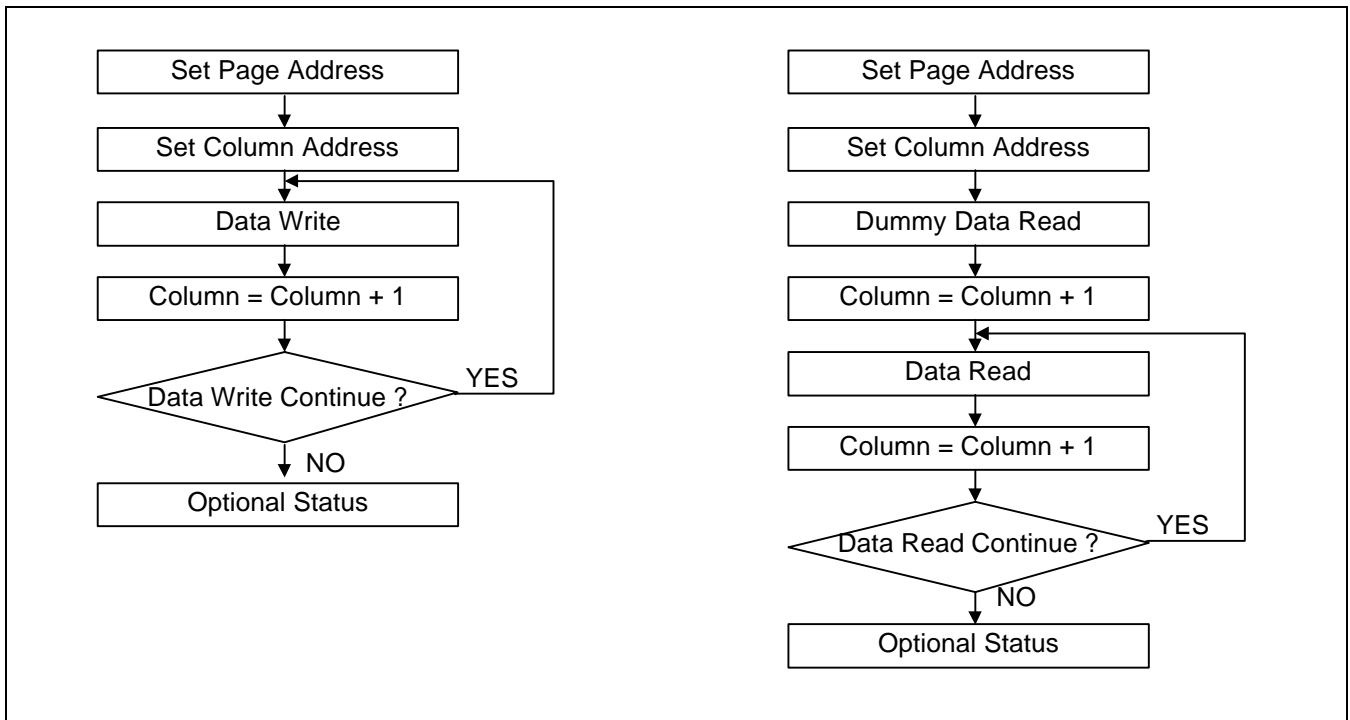

Figure 25. Sequence for Writing Display Data

Figure 26. Sequence for Reading Display Data

Read Status

Indicates the internal status of the KS0741

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	1	BUSY	ON/OFF	RES	MF2	MF1	MF0	DS1	DS0

Flag	Description
BUSY	The device is busy when internal operation or reset. Any instruction is rejected until BUSY goes Low. 0: chip is active, 1: chip is being busy
ON / OFF	Indicates display ON / OFF status 0: display OFF, 1: display ON
RESET	Indicates the initialization is in progress by RESET signal. 0: chip is active, 1: chip is being reset
MF	Manufacturer ID, MF2 MF1 MF0 = [0 0 0]
DS	Display size ID, DS1 DS0 = [1 0]

ICON control register ON/OFF

This instruction makes ICON enable or disable. By default, ICON display is disabled (ICON= 0). When ICON control register is set to "1", ICON display is enabled and page address is set to "16". Then user can write data for icons. It is impossible to set the page address to "16" by Set Page Address instruction. Therefore, when writing data for icons, ICON control register ON instruction would be used to set the page address to "16". When ICON control register is set to "0", ICON display is disabled.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	0	0	0	1	ICON

ICON=0: ICON disable (default)

ICON=1: ICON enable & set the page address to 16

Set Page Address

Sets the Page Address of display data RAM from the microprocessor into the page address register. Any RAM data bit can be accessed when its Page Address and column address are specified. Along with the column address, the Page Address defines the address of the display RAM to write or read display data. Changing the Page Address doesn't effect to the display status. Set Page Address instruction can not be used to set the page address to "16". Use ICON control register ON/OFF instruction to set the page address to "16".

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	1	P3	P2	P1	P0

P3	P2	P1	P0	Page
0	0	0	0	0
0	0	0	1	1
:	:	:	:	:
1	1	1	0	14
1	1	1	1	15

Set Column Address

Sets the Column Address of display RAM from the microprocessor into the column address register. Along with the Column Address, the Column Address defines the address of the display RAM to write or read display data. When the microprocessor reads or writes display data to or from display RAM, Column Addresses are automatically increased.

Set Column Address MSB

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	1	0	Y7	Y6	Y5

Set Column Address LSB

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	Y4	Y3	Y2	Y1

Y7	Y6	Y5	Y4	Y3	Y2	Y1	Column address [Y7:Y1]

0	0	0	0	0	0	1	1
:	:	:	:	:	:	:	:
1	1	1	1	1	1	0	126
1	1	1	1	1	1	1	127

Set Modify-Read

This instruction stops the automatic increment of the column address by the read display data instruction, but the column address is still increased by the write display data instruction. And it reduces the load of microprocessor when the data of a specific area is repeatedly changed during cursor blinking or others. This mode is canceled by the reset Modify-Read instruction.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	0	0	0	0	0

Reset Modify-Read

This instruction cancels the Modify-Read mode, and makes the column address return to its initial value just before the set Modify-Read instruction is started.

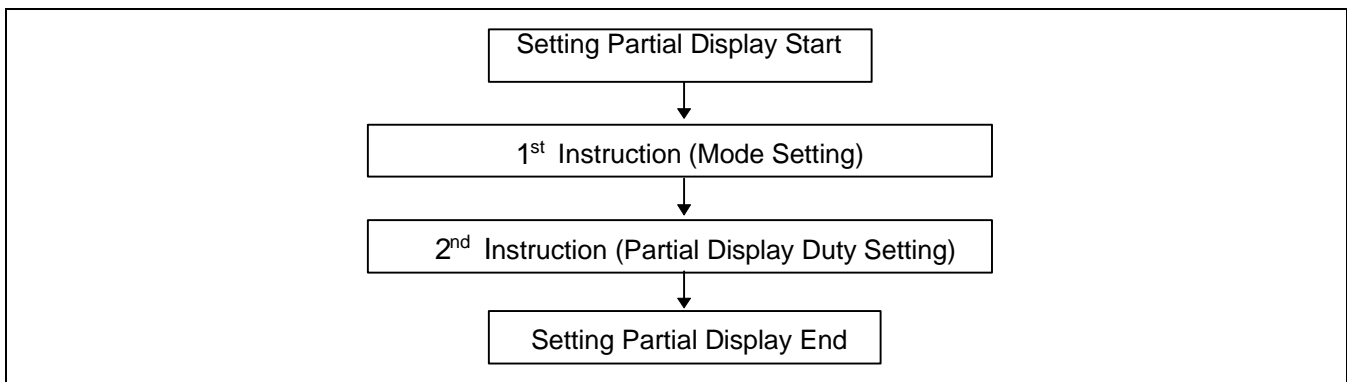

Figure 30. Sequence for Setting Partial Display

Set N-line Inversion Register

Sets the inverted line number within range of 3 to 33 to improve the display quality by controlling the phase of the internal LCD AC signal (M) by using the 2-byte instruction.

The DC-bias problem could be occurred if K is even number. So, we recommend customers to set K to be odd number. K : D/N

D : The number of display duty ratio (D is selectable by customers)

N : N for N-line inversion (N is selectable by customers).

The 1st Instruction

1	1	1	1	1	33-line inversion

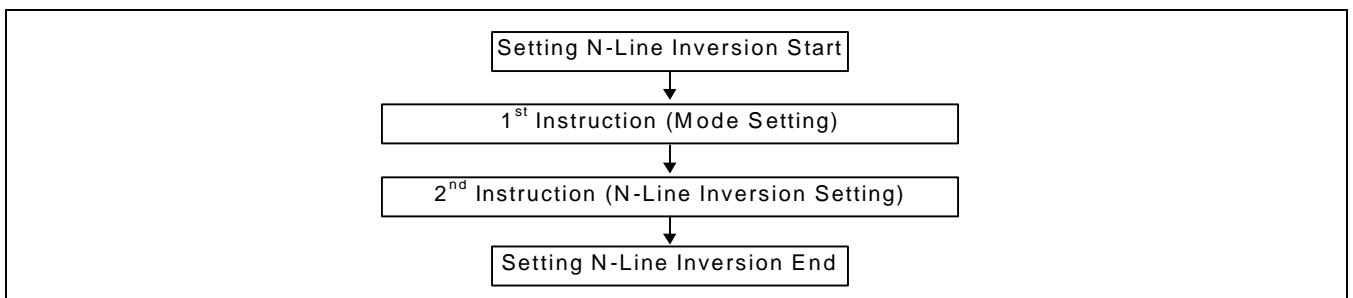

Figure 31. Sequence for N-line Inversion

Release N-line Inversion

Returns to the frame inversion condition from the n-line inversion condition.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	0	0	1	0	0

Reverse Display ON / OFF

Reverses the display status on LCD panel without rewriting the contents of the display data RAM.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	0	0	1	1	REV

REV	DDRAM data = "00" – White	DDRAM data = "01" – Light gray	DDRAM data = "10" – Dark gray	DDRAM data = "11" – Dark
0 (normal)	White ("00")	Light gray ("01")	Dark gray ("10")	Dark ("11")
1 (reverse)	Dark ("11")	Dark gray ("10")	Light gray ("01")	White ("00")

Entire Display ON / OFF

Forces the whole LCD points to be turned on regardless of the contents of the display data RAM. At this time, the contents of the display data RAM are held. This instruction has priority over the Reverse Display ON / OFF instruction.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	0	0	1	0	EON

EON	DDRAM data = "00" – White	DDRAM data = "01" – Light gray	DDRAM data = "10" – Dark gray	DDRAM data = "11" – Dark
0 (normal)	White ("00")	Light gray ("01")	Dark gray ("10")	Dark ("11")
1 (entire)	Dark ("11")	Dark ("11")	Dark ("11")	Dark ("11")

Power Control

Selects one of eight power circuit functions by using 3-bit register. An external power supply and part of internal power supply functions can be used simultaneously.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	1	0	1	VC	VR	VF

VC	VR	VF	Status of internal power supply circuits
0			Internal voltage converter circuit is OFF
1			Internal voltage converter circuit is ON
	0		Internal voltage regulator circuit is OFF
	1		Internal voltage regulator circuit is ON
		0	Internal voltage follower circuit is OFF
		1	Internal voltage follower circuit is ON

Select DC-DC Step-up

Selects one of 4 DC-DC step-up to reduce the power consumption by this instruction. It is very useful to realize the partial display function.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	1	0	0	1	DC1	DC0

DC1	DC0	Selected DC-DC converter circuit
0	0	3 times boosting circuit
0	1	4 times boosting circuit
1	0	5 times boosting circuit
1	1	6 times boosting circuit

Select Regulator Resistor

Selects resistance ratio of the internal resistor used in the internal voltage regulator. See voltage regulator section in power supply circuit. Refer to the table 14.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	1	0	0	R2	R1	R0

R2	R1	R0	$1+ (Rb / Ra)$
0	0	0	2.3
0	0	1	3.0
0	1	0	3.7
0	1	1	4.4
1	0	0	5.1
1	0	1	5.8
1	1	0	6.5
1	1	1	7.2

Set Electronic Volume Register

Consist of 2-byte Instructions

The 1st instruction set Reference Voltage mode, the 2nd one updates the contents of reference voltage register. After second instruction, Reference Voltage mode is released.

The 1st Instruction: Set Reference Voltage Select Mode

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	0	0	0	0	0	1

The 2nd Instruction: Set Reference Voltage Register

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	×	×	EV5	EV4	EV3	EV2	EV1	EV0

EV5	EV4	EV3	EV2	EV1	EV0	Reference voltage parameter (a)
0	0	0	0	0	0	0
0	0	0	0	0	1	1
:	:	:	:	:	:	:
:	:	:	:	:	:	:
1	1	1	1	1	0	62
1	1	1	1	1	1	63

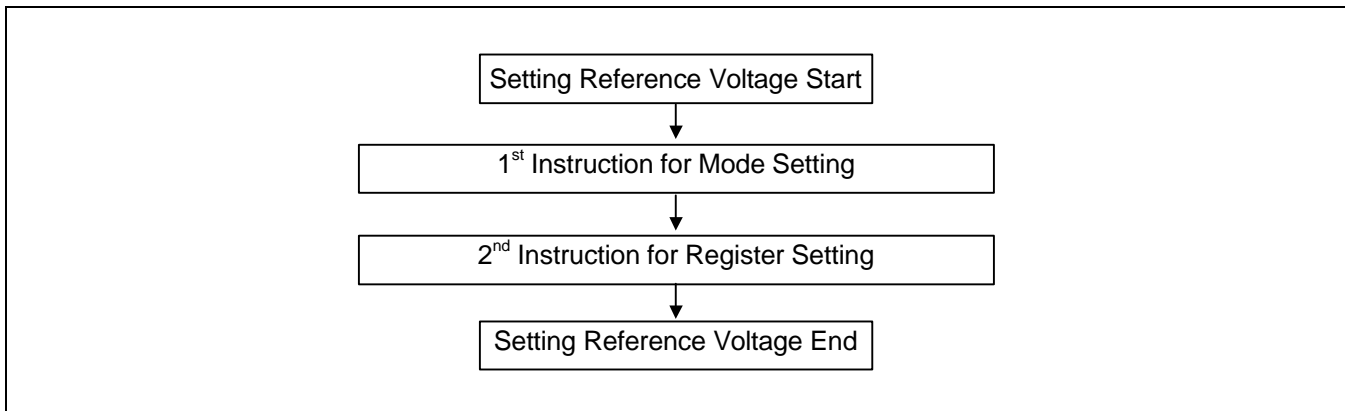

Figure 32. Sequence for Setting the Electronic Volume

Select LCD Bias

Selects LCD bias ratio of the voltage required for driving the LCD.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	0	1	0	B2	B1	B0

B2	B1	B0	LCD bias
0	0	0	1/5
0	0	1	1/6
0	1	0	1/7
0	1	1	1/8
1	0	0	1/9
1	0	1	1/10
1	1	0	1/11
1	1	1	1/12

SHL Select

COM output scanning direction is selected by this instruction which determines the LCD driver output status.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	0	0	SHL	×	×	×

× : Don't care

SHL = 0: normal direction (COM0 → COM127)

SHL = 1: reverse direction (COM127 → COM0)

ADC Select

Changes the relationship between RAM column address and segment driver. The direction of segment driver output pins could be reversed by software. This makes IC layout flexible in LCD module assembly.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	0	0	0	0	ADC

ADC = 0: normal direction (SEG0 → SEG127)

ADC = 1: reverse direction (SEG127 → SEG0)

Oscillator ON Start

This instruction enables the built-in oscillator circuit.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	0	1	0	1	1

Power Save

The KS0741 enters the Power Save status to reduce the power consumption to the static power consumption value and returns to the normal operation status by the following instructions.

Set Power Save Mode

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	0	1	0	0	P

P = 0: normal mode

P = 1: sleep mode

Release Power Save Mode

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	0	0	0	0	1

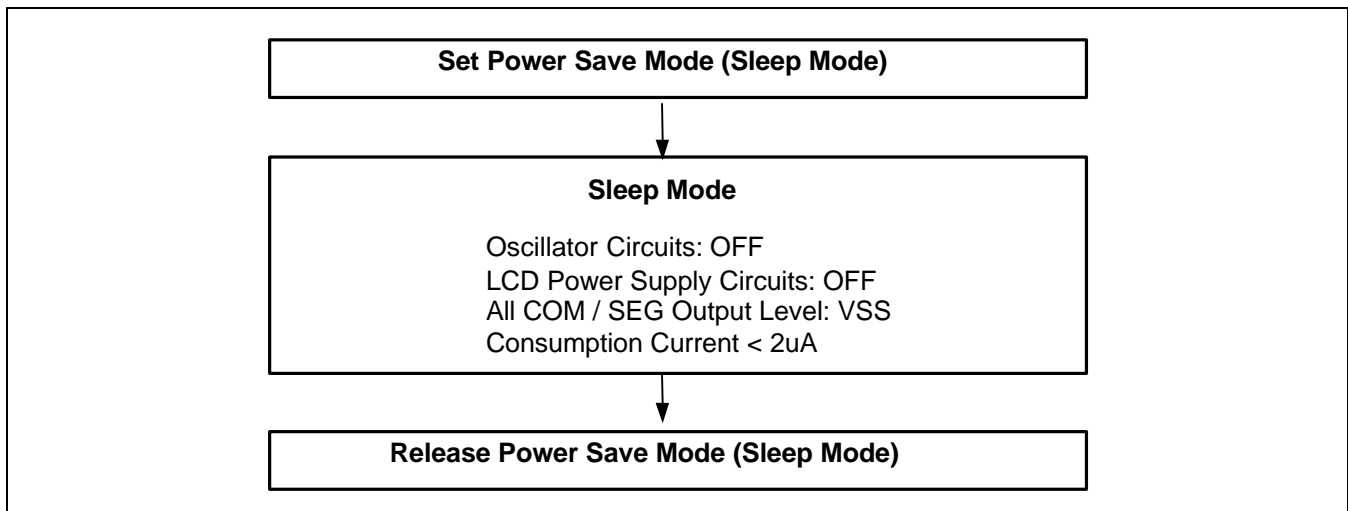

Figure 33. Power Save Routine

Reset

This instruction Resets initial display line, column address, page address, and common output status select to their initial status, but dose not affect the contents of display data RAM. This instruction cannot initialize the LCD power supply, which is initialized by the RESETB pin.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	0	0	0	1	0

Set Data Direction & Display Data Length (3-Pin SPI Mode)

Consists of 2 bytes instruction.

This command is used in 3-Pin SPI mode only(PS0 = "L" and PS1 = "L"). It will be two continuous commands, the first byte control the data direction(write mode only) and inform the LCD driver the second byte will be number of data bytes will be write. When RS is not used, the Display Data Length instruction is used to indicate that a specified number of display data bytes are to be transmitted. The next byte after the display data string is handled as command data.

The 1st Instruction: Set Data Direction (Only Write Mode)

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
x	x	1	1	1	0	1	0	0	0

The 2nd Instruction: Set Display Data Length (DDL) Register

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
x	x	D7	D6	D5	D4	D3	D2	D1	D0

D7	D6	D5	D4	D3	D2	D1	D0	Display Data Length

1	1	1	1	1	1	1	0	255
1	1	1	1	1	1	1	1	256

NOP

No operation

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	0	0	0	1	1

Test Instruction

This instruction is for testing IC. Please do not use it.

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	1	×	×	×	×

Set PWM & FRC mode

Selects 3/4 FRC and 9 / 12 / 15 PWM

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	0	1	0	FRC	PWM1	PWM0

FRC	PWM1	PWM0	Status of PWM & FRC
0			4FRC
1			3FRC
	0	0	9PWM
	0	1	9PWM
	1	0	12PWM
	1	1	15PWM

Set Gray Scale Mode & Register

Consists of 2 bytes instruction. The first byte sets grayscale mode and the second byte updates the contents of gray scale register without issuing any other instruction.

– Set Gray Scale Mode

RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	0	0	1	GM2	GM1	GM0

GM2	GM1	GM0	Description
0	0	0	In case of setting white mode and 1 st / 2 nd frame
0	0	1	In case of setting white mode and 3 rd / 4 th frame

SPECIFICATIONS

ABSOLUTE MAXIMUM RATINGS

Table 18. Absolute Maximum Ratings

(V_{SS} = 0V)

Parameter	Symbol	Rating	Unit
Supply voltage range	V _{DD}	- 0.3 ~ + 7.0	V
	V ₀ , V _{OUT}	- 0.3 ~ + 17.0	V
	V ₁ , V ₂ , V ₃ , V ₄	- 0.3 ~ V ₀ + 0.3	V
External reference voltage	V _{EXT}	+0.3 ~ V _{DD}	
Input voltage range	V _{IN}	- 0.3 ~ V _{DD} + 0.3	V
Operating temperature range	T _{OPR}	- 40 ~ + 85	°C
Storage temperature range	T _{STR}	- 55 ~ + 125	°C

NOTES:

1. V_{DD}, V₀, V_{OUT}, V₁ to V₄ and V_{EXT} are based on V_{SS} = 0V.
2. Voltages V₀ ≥ V₁ ≥ V₂ ≥ V₃ ≥ V₄ ≥ V_{SS} must always be satisfied. (V_{LCD} = V₀ – V_{SS})
3. If supply voltage exceeds its absolute maximum range, this LSI may be damaged permanently. It is desirable to use this LSI under electrical characteristic conditions during general operation. Otherwise, this LSI may malfunction or reduced LSI reliability may result.

DC CHARACTERISTICS

Table 19. DC Characteristics

(VSS = 0V, VDD = 1.8 to 3.3V, Ta = -40 to 85°C)

Item	Symbol	Condition	Min.	Typ.	Max.	Unit	Pin used	
Operating voltage (1)	VDD		1.8	-	3.3	V	VDD *1	
Operating voltage (2)	V0		4.0	-	15.0	V	V0 *2

Dynamic Current Consumption (1) when An External Power Supply is used.**Table 20. Dynamic Current 1 (External Power)** $(V_{DD} = 3.0V, T_a = 25^{\circ}C)$

Item	Symbol	Condition	Min	Typ	Max	Unit	Pin used
Dynamic current consumption (1)	I_{DD1}	$V_0 - V_{SS} = 11.0V$, duty = 1/128 (Display Off)	-	-	TBD	μA	*10
		$V_0 - V_{SS} = 11.0V$, duty = 1/128 (Display On , Checker Pattern)	-	-	TBD	μA	*10

Dynamic Current Consumption (2) when The Internal Power Supply is ON**Table 21. Dynamic Current 2 (Internal Power)** $(V_{DD} = 3.0V, T_a = 25^{\circ}C)$

Item	Symbol	Condition	Min.	Typ.	Max.	Unit	Pin used
Dynamic current consumption (2)	I_{DD2}	$V_0 - V_{SS} = 12.0V$, x5 boosting, duty = 1/128, normal mode (Display Off)	-	-	TBD	μA	*10
		$V_0 - V_{SS} = 12.0V$, x5 boosting, duty = 1/128, normal mode (Display On , Checker Pattern)	-	-	TBD	μA	*10

Current Consumption during Power Save Mode**Table 22. Power Save Mode Current** $(V_{DD} = 3.0V, T_a = 25^{\circ}C)$

Item	Symbol	Condition	Min.	Typ.	Max.	Unit	Pin used
Sleep mode current	I_{DSS1}	During sleep	-	-	TBD	μA	*10

Table 23. The Relationship between Oscillation Frequency and Frame Frequency

Duty ratio	Item	fCL	fosc
1/N	On-chip oscillator circuit is used	$f_{FR} \times N$	$f_{FR} \times PWM \times 2 \times N$

(fosc: oscillation frequency, fCL: display clock frequency, fFR: frame frequency, N = 16 to 129)

[* Remark Solves]

- *1. Though the wide range of operating voltages is guaranteed, a spike voltage change may affect the voltage assurance during access from the MPU.
- *2. In case of external power supply is applied.
- *3. CSB, RS, DB0 to DB7, E_RD, RW_WR, RESETB, PS1, PS0, INTR, HPMB and REF
- *4. DB0 to DB7
- *5. Applies when the DB0 to DB7 pins are in high impedance.
- *6. Resistance value when -0.1[mA] is applied during the ON status of the output pin SEGn or COMn.
 $R_{ON} [k\Omega] = \Delta V [V] / 0.1 [mA]$ (ΔV : voltage change when -0.1[mA] is applied in the ON status.)
- *7. See Table 23 for the relationship between oscillation frequency and frame frequency.
- *8. The voltage regulator circuit adjusts V0 within the voltage follower operating voltage range.
- *9. On-chip reference voltage source of the voltage regulator circuit to adjust V0.
- *10. Applies to the case where the on-chip oscillation circuit is used and no access is made from the MPU.
 The current consumption, when the built-in power supply circuit is ON or OFF.
 The current flowing through voltage regulation resistors(Rb and Ra) is not included.
 It does not include the current of the LCD panel capacity, wiring capacity, etc.

AC CHARACTERISTICS

Read / Write Characteristics (8080-series MPU)
