- All 16 DTMF signal frequencies.
- 40 ms DTMF signal period and 40 ms pause period.
- Nominal DTMF frequency.
- Low-frequency group and High-frequency group signal levels are the same.
- DTMF signal frequency deviation is within $\pm 1.5\% \pm 2$ Hz.
- Bandwidth limited (0 to 3 kHz) Gaussian noise.
- 350 Hz and 440 Hz dial tone frequencies.
- Error rate of less than 1 in 10,000.
- Referenced to the lowest frequency component of the DTMF signal.
- Twist = High-frequency group tone level \div Low-frequency group tone level.

Pin Assignment

Pin Description

Number	Name	I/O	Description
1	INPUT	I	Input coupling capacitor required. Biased internally to $V_{DD}/2$.
2	OSCO	O	An oscillating circuit is formed by connecting a 4.194304 MHz (LC73861) / 3.579545 MHz (LC73826) oscillator and a capacitor (if needed) between these pins. (To determine whether an external capacitor is needed or not, contact the manufacturer of the oscillator.)
3	OSCI	I	
4	V_{SS}		Supply pin, normally 0 V
5	SD	O	Outputs 4-bit serial decoded DTMF output, least significant bit first.
6	ACK	I	The ACK pin is used to shift out data to the SD pin. Four pulses are needed in order to shift out the 4-bit DTMF code. The data is latched by the shift register before the rising edge of the first pulse.
7	EST	O	Indicates the presence of a DTMF signal when HIGH. (This pin can be monitored and after a short delay, data can be accessed by 4 pulses to ACK.)
8	V_{DD}	O	Supply pin, normally 4.5 V to 5.5 V
