NOTES:

1. t_{CW} is defined as the time from the last occurring transition, either \overline{CE}_1 LOW transition or \overline{CE}_2 HIGH transition, to the time when the writing is finished.
2. t_{WR} is defined as the time from writing finish to address change.
3. t_{AS} is defined as the time from address change to writing start.
4. The writing occurs during an overlapping period of $\overline{CE}_1 = \text{'LOW'}$, $\overline{CE}_2 = \text{'HIGH'}$, and $\overline{WE} = \text{'LOW'}$ (t_{WP}).
5. When I/O pins are in the output state, input signals with the opposite logic level must not be applied.

NOTES:

1. t_{CW} is defined as the time from the last occurring transition, either \overline{CE}_1 LOW transition or CE₂ HIGH transition, to the time when the writing is finished.
2. t_{WR} is defined as the time from writing finish to address change.

4. The writing occurs during an overlapping period of $\overline{CE}_1 = \text{'LOW'}$, CE₂ = 'HIGH,' and $\overline{WE} = \text{'LOW'}$ (t_{WP}).
5. If \overline{CE}_1 LOW transition or CE₂ HIGH transition occurs at the same time or after \overline{WE} LOW transition, the outputs will remain high-impedance.
6. If \overline{CE}_1 HIGH transition or CE₂ LOW transition occurs at the same time or before \overline{WE} HIGH transition, the outputs will remain high-impedance.
7. When I/O pins are in the output state, input signals with the opposite logic level must not be applied.
