F²MC-8L MB89630R Series

MB89635R/T635R/636R/637R/T637R
MB89P637/W637/PV630

■ OUTLINE

The MB89630R series has been developed as a general-purpose version of the F²MC*-8L family consisting of proprietary 8-bit, single-chip microcontrollers.

In addition to a compact instruction set, the microcontrollers contain a variety of peripheral functions such as dual-clock control system, five operating speed control stages, a UART, timers, a PWM timer, a serial interface, an A/D converter, an external interrupt, and a watch prescaler.

*: F²MC stands for FUJITSU Flexible Microcontroller.

■ FEATURES

- High-speed operating capability at low voltage
- Minimum execution time: 0.4 µs@3.5 V, 0.8 µs@2.7 V
- F²MC-8L family CPU core

  Instruction set optimized for controllers
  - Multiplication and division instructions
  - 16-bit arithmetic operations
  - Test and branch instructions
  - Bit manipulation instructions, etc.

- Five types of timers
  8-bit PWM timer: 2 channels (Also usable as a reload timer)
  8-bit pulse-width count timer (Continuous measurement capable, applicable to remote control, etc.)
  16-bit timer/counter
  21-bit timebase timer
- UART
  CLK-synchronous/CLK-asynchronous data transfer capable (6, 7, and 8 bits)
- Serial interface
  Switchable transfer direction to allows communication with various equipment.
- 10-bit A/D converter
  Start by an external input capable

(Continued)

(Continued)

- External interrupt: 4 channels
  Four channels are independent and capable of wake-up from low-power consumption modes (with an edge detection function).
- Low-power consumption modes
  Stop mode (Oscillation stops to minimize the current consumption.)
  Sleep mode (The CPU stops to reduce the current consumption to approx. 1/3 of normal.)
  Subclock mode
  Watch mode
- Bus interface function
  With hold and ready function

■ DIFFERENCES AMONG PRODUCTS

1. Memory Size

Before evaluating using the piggyback product, verify its differences from the product that will actually be used. Take particular care on the following points:

On the MB89P637/W637, the program area starts from address 8007_H but on the MB89PV630 and MB89637R starts from 8000_H.

- On the MB89P637/W637, addresses 8000_H to 8006_H comprise the option setting area, option settings can be read by reading these addresses. On the MB89PV630/MB89637R, addresses 8000_H to 8006_H could also be used as a program ROM. However, do not use these addresses in order to maintain compatibility of the MB89P637/W637.
- The stack area, etc., is set at the upper limit of the RAM.
- The external area is used.

2. Current Consumption

- In the case of the MB89PV630, add the current consumed by the EPROM which connected to the top socket.
- When operated at low speed, the product with an OTPROM (one-time PROM) or an EPROM will consume more current than the product with a mask ROM. However, the current consumption in sleep/stop modes is the same. (For more information, see sections "■ Electrical Characteristics" and "■ Example Characteristics.")

3. Mask Options

Functions that can be selected as options and how to designate these options vary by the product.

Before using options check section "■ Mask Options."

Take particular care on the following points:

- A pull-up resistor cannot be set for P50 to P53 on the MB89P637 and MB89W637.
- Options are fixed on the MB89PV630, MB89T635R, and MB89T637R.

4. Differences between the MB89630 and MB89630R Series

- Memory access area
  There are no difference between the access area of MB89635/MB89635R, and that of MB89637/MB89637R.
  The access area of MB89636 is different from that of the MB89636R when using in external bus mode.

Address	Memory area	
	MB89636	MB89636R
0000_H to $007F_H$	I/O area	I/O area
0080_H to $037F_H$	RAM area	RAM area
0380_H to $047F_H$	External area	Access prohibited
0480_H to $7FFF_H$		External area
8000_H to $9FFF_H$		Access prohibited
$A000_H$ to $FFFF_H$	ROM area	ROM area

- Other specifications
  Both MB89630 series and MB89630R is the same.
- Electrical specifications/electrical characteristics
  Electrical specifications of the MB89630R series are the same as that of the MB89630 series.
  Electrical characteristics of both the series are much the same.

■ CORRESPONDENCE BETWEEN THE MB89630 AND MB89630R SERIES

- The MB89630R series is the reduction version of the MB89630 series.
- The the MB89630 and MB89630R series consist of the following products:

■ PIN DESCRIPTION

Pin no.			Pin name	Circuit type	Function
SH-DIP*1 MDIP*2	QFP2*3	QFP1*4 MQFP*5			
30	22	23	X0	A	Main clock crystal oscillator pins
31	23	24	X1		
28	20	21	MOD0	D	Operating mode selection pins Connect directly to V_{CC} or V_{SS}.
29	21	22	MOD1		
27	19	20	$\overline{RST}$	C	Reset I/O pin This pin is an N-ch open-drain output type with a pull-up resistor, and a hysteresis input type. "L" is output from this pin by an internal reset source. The internal circuit is initialized by the input of "L".
56 to 49	48 to 41	49 to 42	P00/AD0 to P07/AD7	F	General-purpose I/O ports When an external bus is used, these ports function as the multiplex pins of the lower address output and the data I/O.
48 to 41	40 to 33	41 to 34	P10/A08 to P17/A157	F	General-purpose I/O ports When an external bus is used, these ports function as an upper address output.
40	32	33	P20/BUFC	H	General-purpose output port When an external bus is used, this port can also be used as a buffer control output by setting the BCTR.
39	31	32	P21/$\overline{HAK}$	H	General-purpose output port When an external bus is used, this port can also be used as a hold acknowledge by setting the BCTR.
38	30	31	P22/HRQ	F	General-purpose output port When an external bus is used, this port can also be used as a hold request input by setting the BCTR.
37	29	30	P23/RDY	F	General-purpose output port When an external bus is used, this port functions as a ready input.
36	28	29	P24/CLK	H	General-purpose output port When an external bus is used, this port functions as a clock output.
35	27	28	P25/$\overline{WR}$	H	General-purpose output port When an external bus is used, this port functions as a write signal output.
34	26	27	P26/$\overline{RD}$	H	General-purpose output port When an external bus is used, this port functions as a read signal output.

■ HANDLING DEVICES

1. Preventing Latchup

Latchup may occur on CMOS ICs if voltage higher than V_{CC} or lower than V_{SS} is applied to input and output pins other than medium- and high-voltage pins or if higher than the voltage which shows on “1. Absolute Maximum Ratings” in section “■ Electrical Characteristics” is applied between V_{CC} and V_{SS}.

When latchup occurs, power supply current increases rapidly and might thermally damage elements. When using, take great care not to exceed the absolute maximum ratings.

Also, take care to prevent the analog power supply (AV_{CC} and AVR) and analog input from exceeding the digital power supply (V_{CC}) when the analog system power supply is turned on and off.

2. Treatment of Unused Input Pins

Leaving unused input pins open could cause malfunctions. They should be connected to a pull-up or pull-down resistor.

3. Treatment of Power Supply Pins on Microcontrollers with A/D and D/A Converters

Connect to be AV_{CC} = DAVC = V_{CC} and AV_{SS} = AVR = V_{SS} even if the A/D and D/A converters are not in use.

4. Treatment of N.C. Pins

Be sure to leave (internally connected) N.C. pins open.

5. Power Supply Voltage Fluctuations

Although V_{CC} power supply voltage is assured to operate within the rated range, a rapid fluctuation of the voltage could cause malfunctions, even if it occurs within the rated range. Stabilizing voltage supplied to the IC is therefore important. As stabilization guidelines, it is recommended to control power so that V_{CC} ripple fluctuations (P-P value) will be less than 10% of the standard V_{CC} value at the commercial frequency (50 Hz to 60 Hz) and the transient fluctuation rate will be less than 0.1 V/ms at the time of a momentary fluctuation such as when power is switched.

6. Precautions when Using an External Clock

When an external clock is used, oscillation stabilization time is required even for power-on reset (option selection) and wake-up from stop mode.

■ PROGRAMMING TO THE EPROM ON THE MB89P637

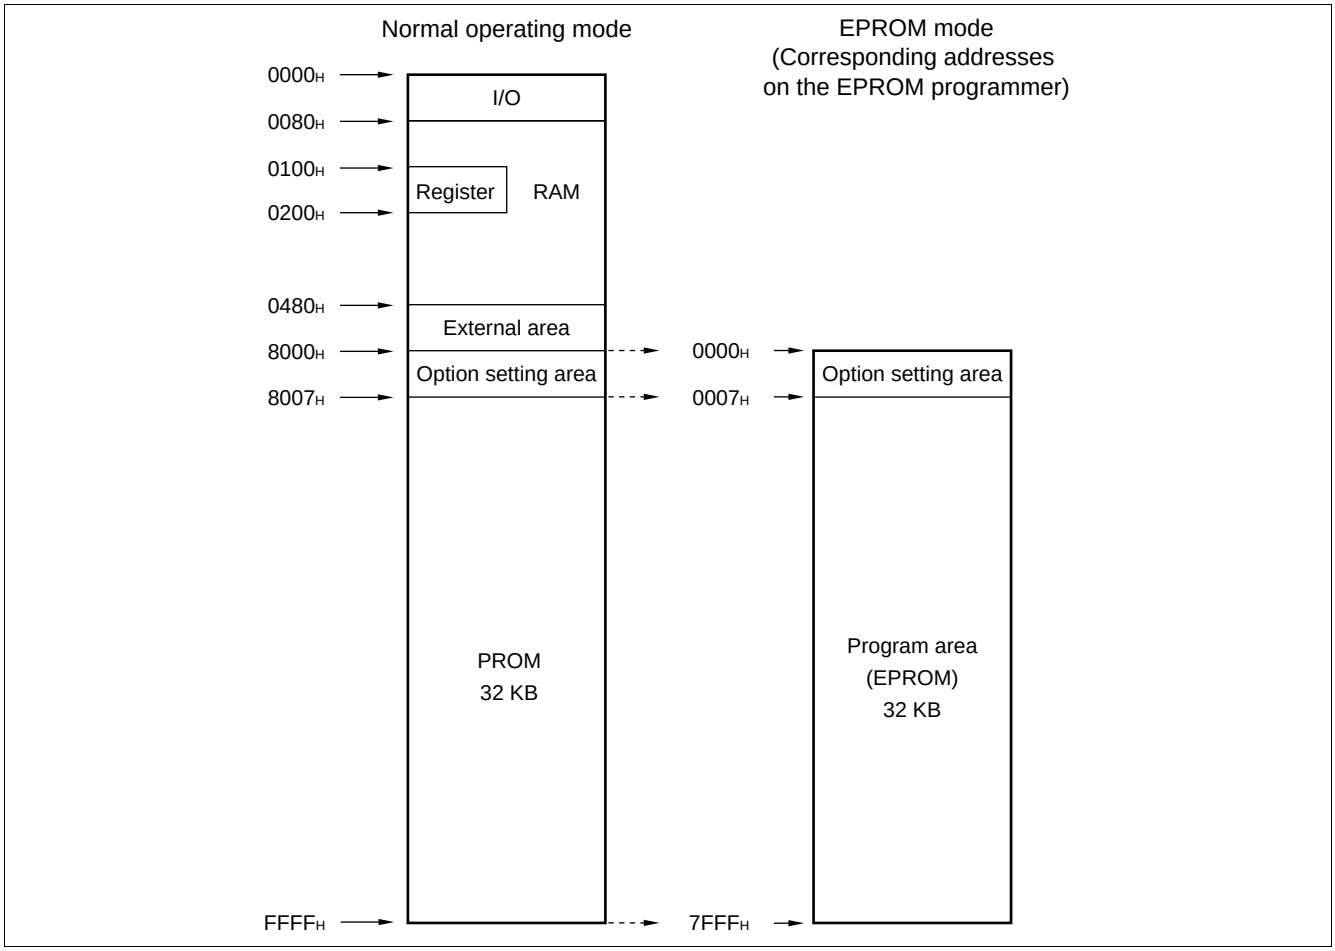
The MB89P637 is an OTPROM version of the MB89630 series.

1. Features

- 32-Kbytes PROM on chip
- Options can be set using the EPROM programmer.
- Equivalency to the MBM27C256A in EPROM mode (when programmed with the EPROM programmer)

2. Memory Space

Memory space in each mode is illustrated below.



3. Programming to the EPPROM

In EPROM mode, the MB89P637 functions equivalent to the MBM27C256A. This allows the PROM to be programmed with a general-purpose EPROM programmer by using the dedicated socket adapter.

However, the electronic signature mode cannot be used.

When the operating ROM area for a single chip is 32 Kbytes (8007_H to $FFFF_H$) the EPROM can be programmed as follows:

- **Programming procedure**

(1) Set the EPROM programmer to the MBM27C256A-20CZ and MBM27C256A-20TV.

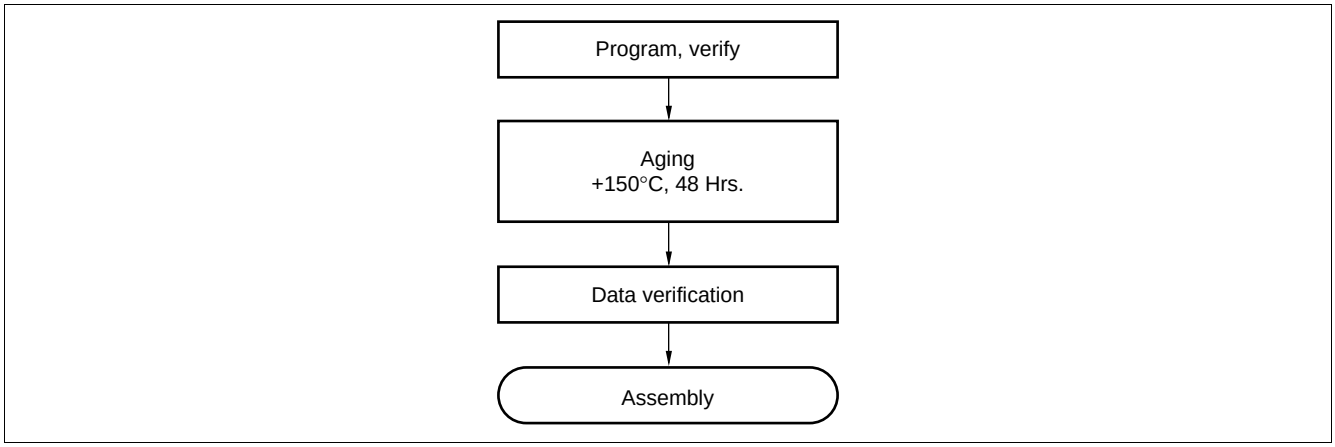
(2) Load program data into the EPROM programmer at 0007_H to $7FFF_H$. (Note that addresses 8000_H to $FFFF_H$ in the operating mode assign to 0000_H to $7FFF_H$ in EPROM mode).

(3) Load option data into addresses 0000_H to 0006_H of the EPROM programmer.
(For information about each corresponding option, see “8. OTPROM Option Bit Map.”)

(4) Program with the EPROM programmer.

4. Recommended Screening Conditions

High-temperature aging is recommended as the pre-assembly screening procedure for a product with a blanked OTPROM microcomputer program.



5. Programming Yield

All bits cannot be programmed at Fujitsu shipping test to a blanked OTPROM microcomputer, due to its nature. For this reason, a programming yield of 100% cannot be assured at all times.

6. Erasure

In order to clear all locations of their programmed contents, it is necessary to expose the internal EPROM to an ultraviolet light source. A dosage of 10 W-seconds/cm^2 is required to completely erase an internal EPROM. This dosage can be obtained by exposure to an ultraviolet lamp (wavelength of 2537 Angstroms (Å)) with intensity of 12000 μW/cm^2 for 15 to 21 minutes. The internal EPROM should be about one inch from the source and all filters should be removed from the UV light source prior to erasure.

It is important to note that the internal EPROM and similar devices, will erase with light sources having wavelengths shorter than 4000 Å. Although erasure time will be much longer than with UV source at 2537 Å, nevertheless the exposure to fluorescent light and sunlight will eventually erase the internal EPROM, and exposure to them should be prevented to realize maximum system reliability. If used in such an environment, the package windows should be covered by an opaque label or substance.

■ PROGRAMMING TO THE EPROM WITH PIGGYBACK/EVALUATION DEVICE

1. EPROM for Use

MBM27C256A-20CZ, MBM27C256A-20TV

2. Programming Socket Adapter

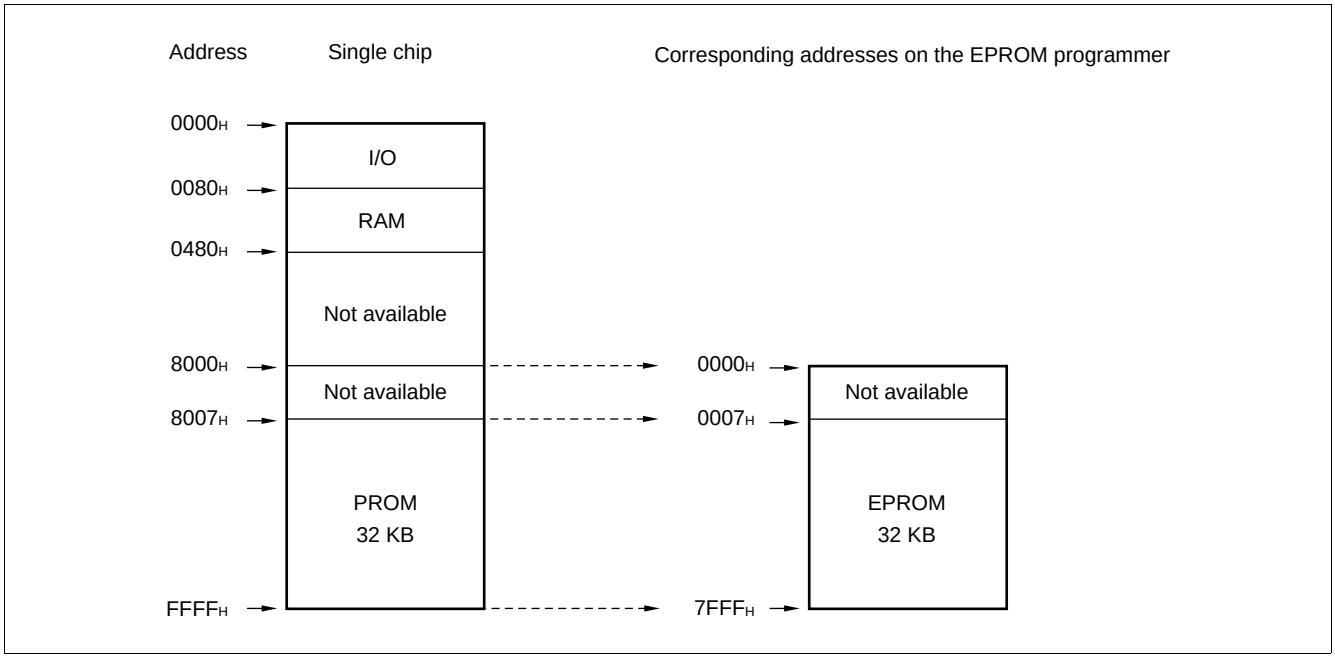
To program to the PROM using an EPROM programmer, use the socket adapter (manufacturer: Sun Hayato Co., Ltd.) listed below.

Package	Adapter socket part number
LCC-32 (Rectangle)	ROM-32LC-28DP-YG

Inquiry: Sun Hayato Co., Ltd.: TEL: (81)-3-3986-0403
FAX : (81)-3-5396-9106

3. Memory Space

Memory space in each mode, such as 32-Kbyte PROM, option area is diagrammed below.



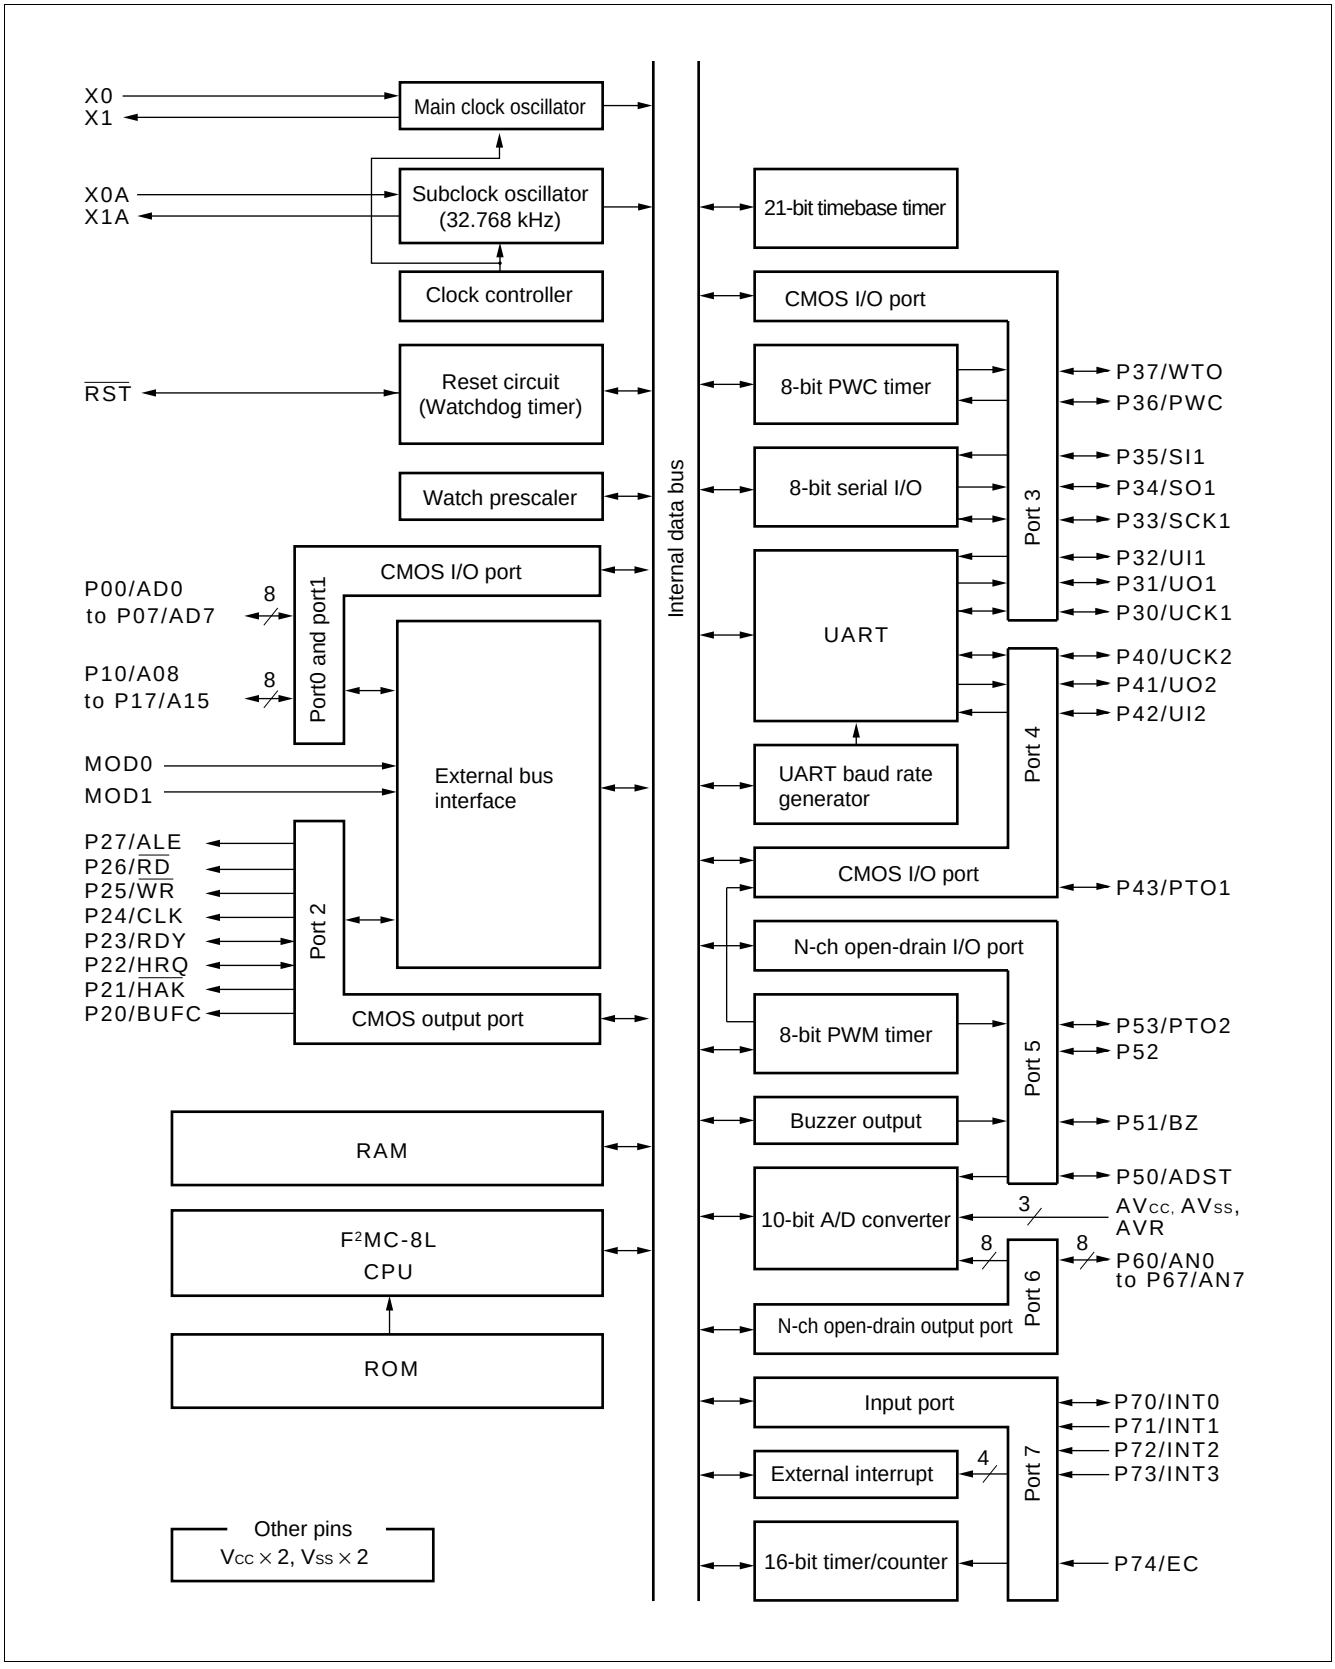
4. Programming to the EPROM

(1) Set the EPROM programmer to the MBM27C256A.

(2) Load program data into the EPROM programmer at 0007_H to $7FFF_H$.

(3) Program to 0000_H to $7FFF_H$ with the EPROM programmer.

■ BLOCK DIAGRAM

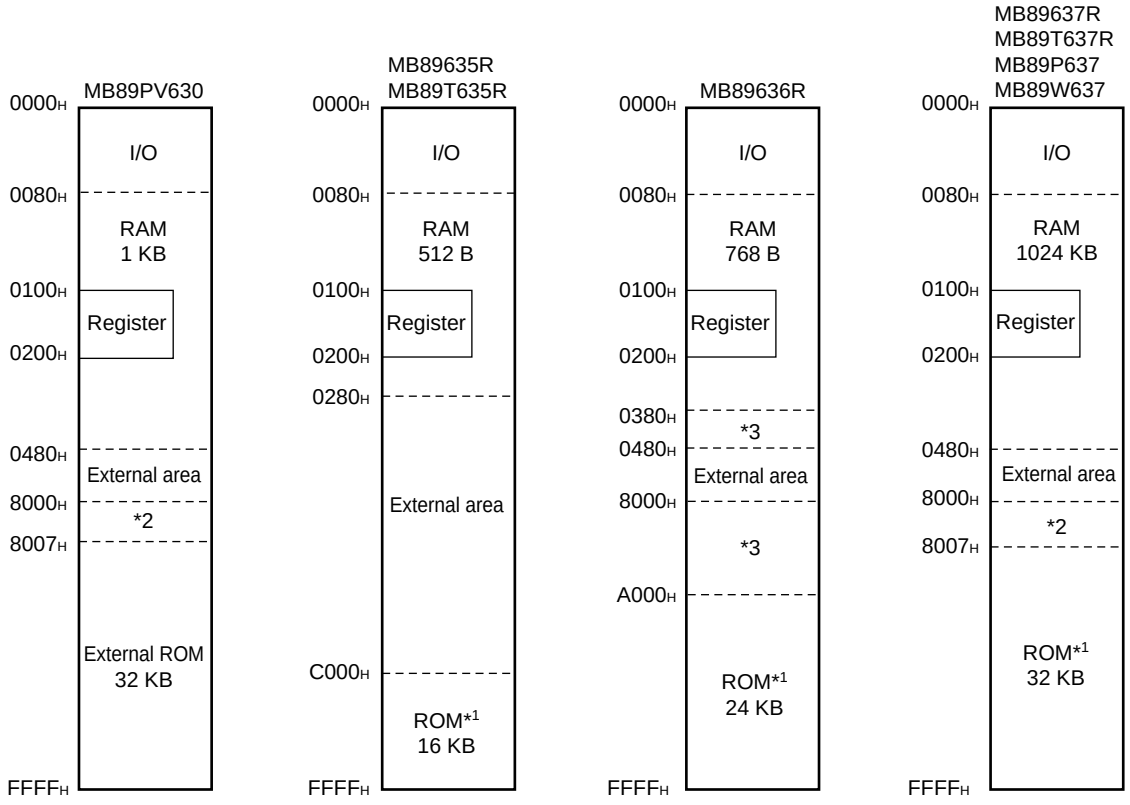


■ CPU CORE

1. Memory Space

The microcontrollers of the MB89630R series offer 64 Kbytes of memory for storing all of I/O, data, and program areas. The I/O area is located at the lowest address. The data area is provided immediately above the I/O area. The data area can be divided into register, stack, and direct areas according to the application. The program area is located at exactly the opposite end of I/O area, that is, near the highest address. Provide the tables of interrupt reset vectors and vector call instructions toward the highest address within the program area. The memory space of the MB89630R series is structured as illustrated below.

• Memory space



*1: The ROM area is an external area depending on the mode.
The internal ROM cannot be used on the MB89T635R and MB89T637R.

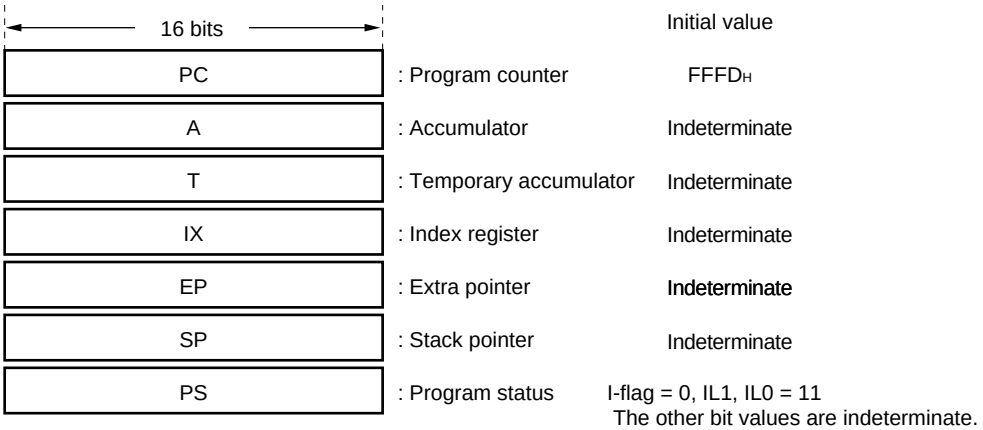
*2: Addresses 8000H to 8006H for the MB89P637 and MB89W637 comprise an option area, do not use this area for the MB89PV630 and MB89637R.

*3: The access is forbidden in the external bus mode.

2. Registers

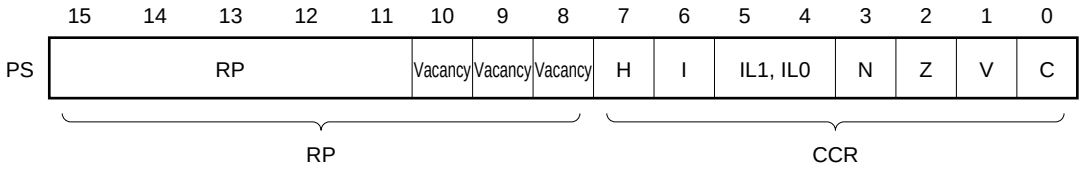
The F²MC-8L family has two types of registers; dedicated registers in the CPU and general-purpose registers in the memory. The following dedicated registers are provided:

Program counter (PC):	A 16-bit register for indicating the instruction storage positions
Accumulator (A):	A 16-bit temporary register for storing arithmetic operations, etc. When the instruction is an 8-bit data processing instruction, the lower byte is used.
Temporary accumulator (T):	A16-bit register which performs arithmetic operations with the accumulator When the instruction is an 8-bit data processing instruction, the lower byte is used.
Index register (IX):	A16-bit register for index modification
Extra pointer (EP):	A16-bit pointer for indicating a memory address
Stack pointer (SP):	A16-bit register for indicating a stack area
Program status (PS):	A16-bit register for storing a register pointer, a condition code



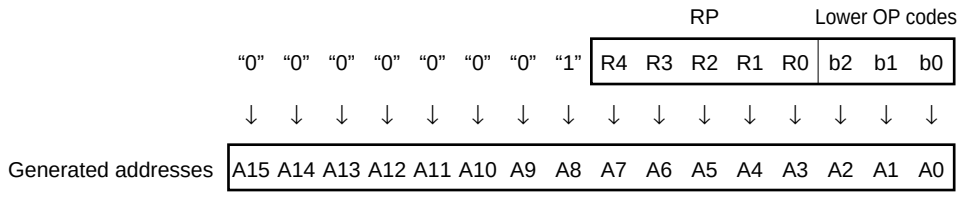
The PS can further be divided into higher 8 bits for use as a register bank pointer (RP) and the lower 8 bits for use as a condition code register (CCR). (See the diagram below.)

• Structure of the program status register



The RP indicates the address of the register bank currently in use. The relationship between the pointer contents and the actual address is based on the conversion rule illustrated below.

• Rule for conversion of actual addresses of the general-purpose register area



The CCR consists of bits indicating the results of arithmetic operations and the contents of transfer data and bits for control of CPU operations at the time of an interrupt.

H-flag: Set to '1' when a carry or a borrow from bit 3 to bit 4 occurs as a result of an arithmetic operation. Cleared to '0' otherwise. This flag is for decimal adjustment instructions.

I-flag: Interrupt is enabled when this flag is set to '1'. Interrupt is disabled when the flag is cleared to '0'. Cleared to '0' at the reset.

IL1, IL0: Indicates the level of the interrupt currently allowed. Processes an interrupt only if its request level is higher than the value indicated by this bit.

IL1	IL0	Interrupt level	High-low
0	0	1	High
0	1		
1	0	2	
1	1	3	Low

N-flag: Set to '1' if the MSB becomes to '1' as the result of an arithmetic operation. Cleared to '0' when the bit is cleared to '0'.

Z-flag: Set to '1' when an arithmetic operation results in 0. Cleared to '0' otherwise.

V-flag: Set to '1' if the complement on 2 overflows as a result of an arithmetic operation. Cleared to '0' if the overflow doesnot occur.

C-flag: Set to '1' when a carry or a borrow from bit 7 occurs as a result of an arithmetic operation. Cleared to '0' otherwise.
Set to the shift-out value in the case of a shift instruction.

The following general-purpose registers are provided:

General-purpose registers: An 8-bit register for storing data

The general-purpose registers are 8 bits and located in the register banks of the memory. One bank contains eight registers and up to a total of 32 banks can be used on the MB89653A (RAM 512 × 8 bits). The bank currently in use is indicated by the register bank pointer (RP).

"H" level maximum output current	I_{OH}	—	–20	mA	
"H" level average output current	I_{OHAV}	—	–4	mA	Average value (operating current × operating rate)
"H" level total maximum output current	$\sum I_{OH}$	—	–50	mA	
"H" level total average output current	$\sum I_{OHAV}$	—	–20	mA	Average value (operating current × operating rate)
Power consumption	P_D	—	500	mW	
Operating temperature	T_A	–40	+85	°C	
Storage temperature	Tstg	–55	+150	°C	

* : Use AV_{CC} and V_{CC} set at the same voltage.
Take care so that AV_{CC} does not exceed V_{CC}, such as when power is turned on.

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

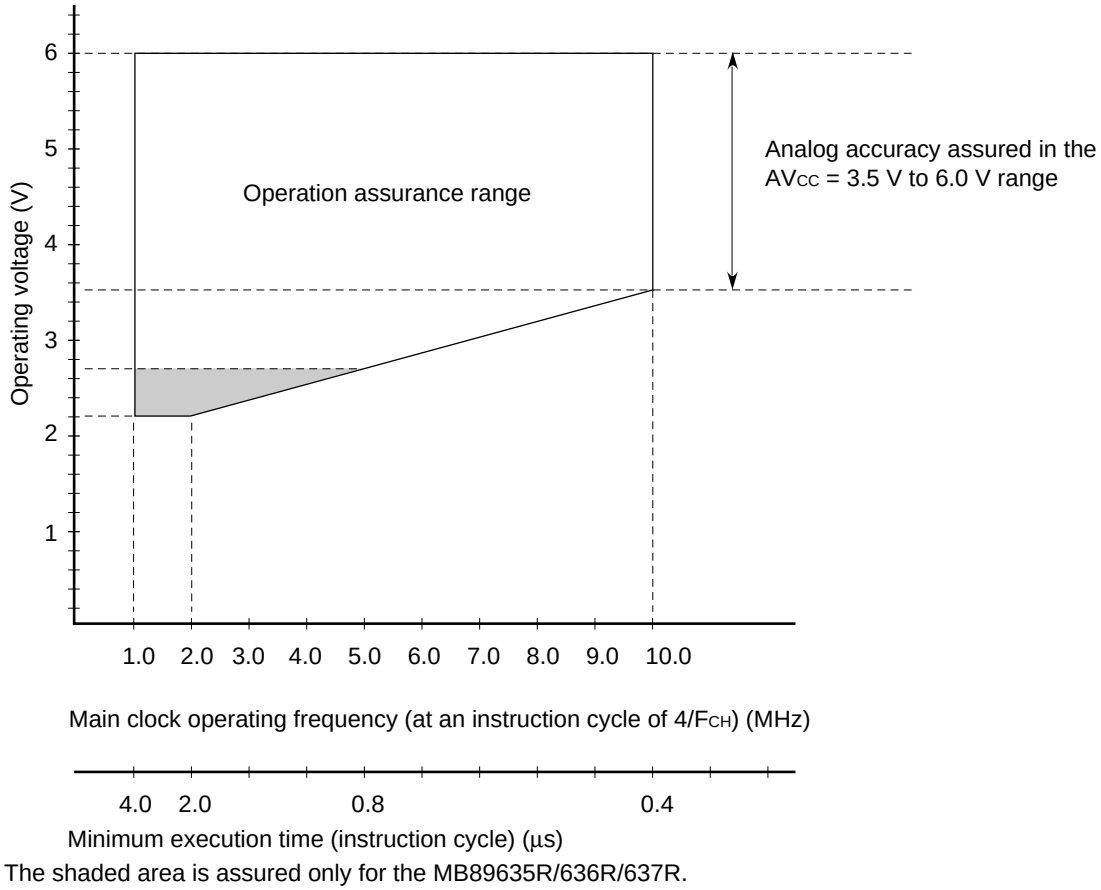
2. Recommended Operating Conditions

(AV_{SS} = V_{SS} = 0.0 V)

Parameter	Symbol	Value		Unit	Remarks
		Min.	Max		
Power supply voltage	V_{CC}	2.2*	6.0*	V	Normal operation assurance range* MB89635R/637R
		2.7*	6.0*	V	Normal operation assurance range* MB89PV630/P637/ W637/T635R/T637R
	AV_{CC}	1.5	6.0	V	Retains the RAM state in stop mode
A/D converter reference input voltage	AVR	3.0	AV_{CC}	V	
Operating temperature	T_A	–40	+85	°C	

* : These values vary with the operating frequency, instruction cycle, and analog assurance range. See Figure 1 and “5. A/D Converter Electrical Characteristics.”

Figure 1 Operating Voltage vs. Main Clock Operating Frequency



Note: The shaded area is assured only for the MB89635R/636R/637R.

Figure 1 indicates the operating frequency of the external oscillator at an instruction cycle of $4/F_{CH}$.
Since the operating voltage range is dependent on the instruction cycle, see minimum execution time if the operating speed is switched using a gear.

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representatives beforehand.

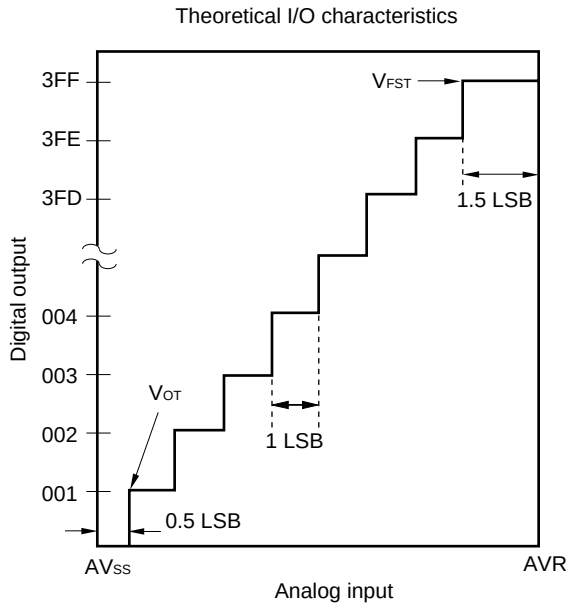
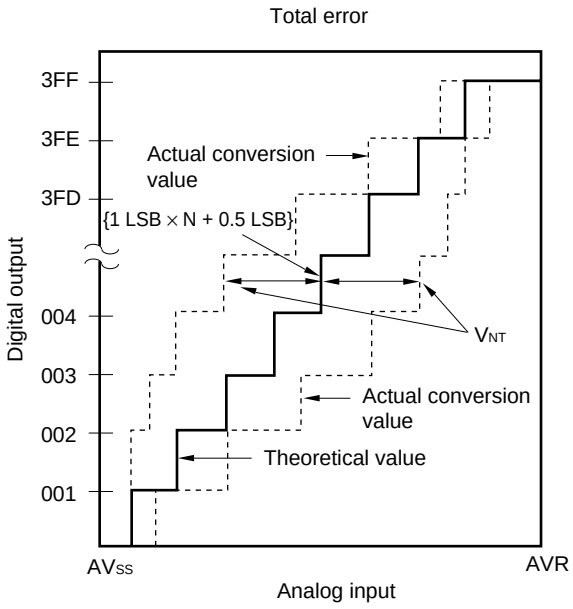
6. A/D Converter Glossary

- Resolution
  Analog changes that are identifiable with the A/D converter
- Linearity error
  The deviation of the straight line connecting the zero transition point (“00 0000 0000” ↔ “00 0000 0001”) with the full-scale transition point (“11 1111 1110” ↔ “11 1111 1111”) from actual conversion characteristics
- Differential linearity error
  The deviation of input voltage needed to change the output code by 1 LSB from the theoretical value
- Total error (unit: LSB)
  The difference between theoretical and actual conversion values caused by the zero transition error, full-scale transition error, linearity error, quantization error, and noise





$$1\ \text{LSB} = \frac{V_{FST} - V_{OT}}{1022}\ (\text{V})$$

$$\text{Digital output N total error} = \frac{V_{NT} - \{1\ \text{LSB} \times N + 0.5\ \text{LSB}\}}{1\ \text{LSB}}$$

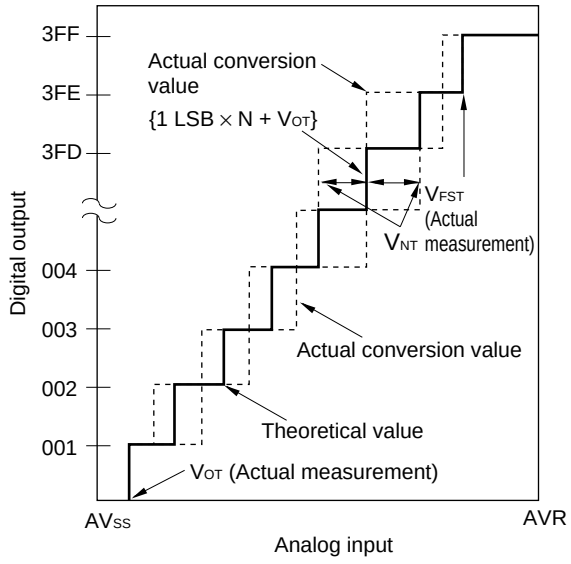
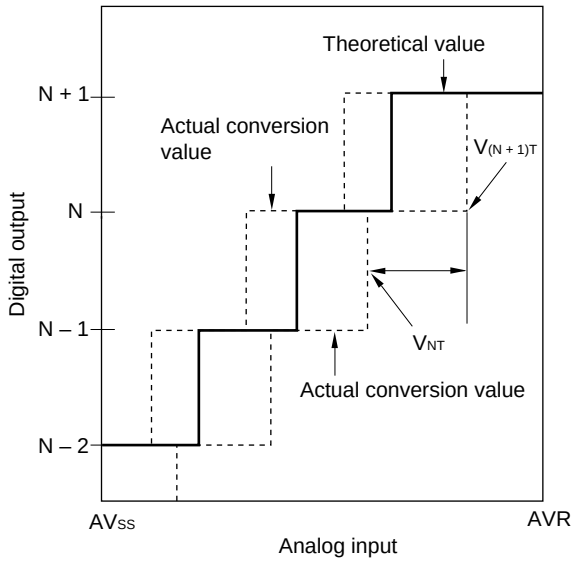
Linearity error



Differential linearity error



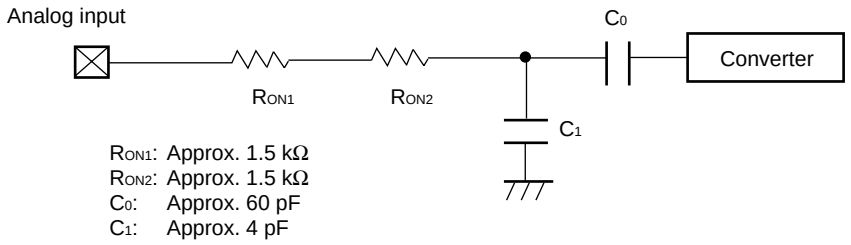
$$\text{Digital output N linearity error} = \frac{V_{NT} - \{1\ \text{LSB} \times N + V_{OT}\}}{1\ \text{LSB}}$$

$$\text{Digital output N differential linearity error} = \frac{V_{(N+1)T} - V_{NT}}{1\ \text{LSB}} - 1$$

7. Notes on Using A/D Converter

- **Input impedance of the analog input pins**
  The output impedance of the external circuit for the analog input must satisfy the followingconditions.
  If the output impedance of the external circuit is too high, an analog voltage sampling time might beinsufficient (sampling time = 6 µs at 10MHz oscillation.) Therefore, it is recommended to keep the output impedance of the external circuit below 10 kΩ .

- **Analog input circuit model**



R_{ON1}: Approx. 1.5 kΩ
R_{ON2}: Approx. 1.5 kΩ
C_0: Approx. 60 pF
C_1: Approx. 4 pF

Note: The values mentioned here should be used as a guideline.

- **Error**
  The smaller the | AVR–AVss |, the greater the error would become relatively.

■ INSTRUCTIONS (136 INSTRUCTIONS)

Execution instructions can be divided into the following four groups:
- Transfer
- Arithmetic operation
- Branch
- Others

Table 1 lists symbols used for notation of instructions.

Table 1 Instruction Symbols

Symbol	Meaning
dir	Direct address (8 bits)
off	Offset (8 bits)
ext	Extended address (16 bits)
#vct	Vector table number (3 bits)
#d8	Immediate data (8 bits)
#d16	Immediate data (16 bits)
dir: b	Bit direct address (8:3 bits)
rel	Branch relative address (8 bits)
@	Register indirect (Example: @A, @IX, @EP)
A	Accumulator A (Whether its length is 8 or 16 bits is determined by the instruction in use.)
AH	Upper 8 bits of accumulator A (8 bits)
AL	Lower 8 bits of accumulator A (8 bits)
T	Temporary accumulator T (Whether its length is 8 or 16 bits is determined by the instruction in use.)
TH	Upper 8 bits of temporary accumulator T (8 bits)
TL	Lower 8 bits of temporary accumulator T (8 bits)
IX	Index register IX (16 bits)
EP	Extra pointer EP (16 bits)
PC	Program counter PC (16 bits)
SP	Stack pointer SP (16 bits)
PS	Program status PS (16 bits)
dr	Accumulator A or index register IX (16 bits)
CCR	Condition code register CCR (8 bits)
RP	Register bank pointer RP (5 bits)
Ri	General-purpose register Ri (8 bits, i = 0 to 7)
×	Indicates that the very × is the immediate data. (Whether its length is 8 or 16 bits is determined by the instruction in use.)
(×)	Indicates that the contents of × is the target of accessing. (Whether its length is 8 or 16 bits is determined by the instruction in use.)
((×))	The address indicated by the contents of × is the target of accessing. (Whether its length is 8 or 16 bits is determined by the instruction in use.)

Columns indicate the following:

Mnemonic: Assembler notation of an instruction

~: The number of instructions

#: The number of bytes

Operation: Operation of an instruction

TL, TH, AH: A content change when each of the TL, TH, and AH instructions is executed. Symbols in the column indicate the following:
- "–" indicates no change.
- dH is the 8 upper bits of operation description data.
- AL and AH must become the contents of AL and AH prior to the instruction executed.
- 00 becomes 00.

N, Z, V, C: An instruction of which the corresponding flag will change. If + is written in this column, the relevant instruction will change its corresponding flag.

OP code: Code of an instruction. If an instruction is more than one code, it is written according to the following rule:
Example: 48 to 4F ← This indicates 48, 49, ... 4F.

FUJITSU LIMITED

The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information and circuit diagrams in this document are presented as examples of semiconductor device applications, and are not intended to be incorporated in devices for actual use. Also, FUJITSU is unable to assume responsibility for infringement of any patent rights or other rights of third parties arising from the use of this information or circuit diagrams.

The products described in this document are designed, developed and manufactured as contemplated for general use, including without limitation, ordinary industrial use, general office use, personal use, and household use, but are not designed, developed and manufactured as contemplated (1) for use accompanying fatal risks or dangers that, unless extremely high safety is secured, could have a serious effect to the public, and could lead directly to death, personal injury, severe physical damage or other loss (i.e., nuclear reaction control in nuclear facility, aircraft flight control, air traffic control, mass transport control, medical life support system, missile launch control in weapon system), or (2) for use requiring extremely high reliability (i.e., submersible repeater and artificial satellite).
Please note that Fujitsu will not be liable against you and/or any third party for any claims or damages arising in connection with above-mentioned uses of the products.

Any semiconductor devices have an inherent chance of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Law of Japan, the prior authorization by Japanese government will be required for export of those products from Japan.
