## F<sup>2</sup>MC-16LX MB90580B Series

# MB90583B/587/F583B/V580B

### ■ DESCRIPTION

The MB90580B series is a line of general-purpose, Fujitsu 16-bit microcontrollers designed for process control applications which require high-speed real-time processing, such as consumer products.

While inheriting the AT architecture of the F<sup>2</sup>MC\*<sup>1</sup> family, the instruction set for the F<sup>2</sup>MC-16LX CPU core of the MB90580B series incorporates additional instructions for high-level languages, supports extended addressing modes, and contains enhanced multiplication and division instructions as well as a substantial collection of improved bit manipulation instructions. In addition, the MB90580B has an on-chip 32-bit accumulator which enables processing of long-word data.

The peripheral resources integrated in the MB90580B series include: an 8/10-bit A/D converter, an 8-bit D/A converter, UARTs (SCI) 0 to 4, an 8/16-bit PPG timer, 16-bit I/O timers (16-bit free-run timer, input capture units (ICUs) 0 to 3, output compare units (OCUs) 0 and 1), and an IEBus™ controller \*<sup>2</sup>.

Notes: \*1: F<sup>2</sup>MC stands for FUJITSU Flexible Microcontroller, a registered trademark of FUJITSU LIMITED.

\*2: IEBus™ is a trademark of NEC Corporation.

### ■ FEATURES

- Minimum execution time: 62.5 ns/4 MHz oscillation (Uses PLL clock multiplication) maximum multiplier = 4
- Maximum memory space  
16 Mbyte  
Linear/bank access

### ■ PACKAGES

100 pin plastic LQFP

(FPT-100P-M05)

100 pin plastic QFP

(FPT-100P-M06)

# MB90580B Series

(Continued)

- Instruction set optimized for controller applications
  - Supported data types: bit, byte, word, and long-word types
  - Standard addressing modes: 23 types
  - 32-bit accumulator enhancing high-precision operations
  - Signed multiplication/division and extended RETI instructions
- Enhanced high level language (C) and multitasking support instructions
  - Use of a system stack pointer
  - Symmetrical instruction set and barrel shift instructions
- Program patch function (for two address pointers)
- Enhanced execution speed: 4 byte instruction queue
- Enhanced interrupt function
  - Up to eight priority levels programmable
  - External interrupt inputs: 8 lines
- Automatic data transmission function independent of CPU operation
  - Up to 16 channels for the extended intelligent I/O service
  - DTP request inputs: 8 lines
- Internal ROM
  - FLASH: 128 Kbyte
  - MASKROM: 128 Kbyte (MB90583B) , 64 Kbyte (MB90587)
- Internal RAM
  - FLASH: 6 Kbyte
  - MASKROM: 6 Kbyte (MB90583B) , 4 Kbyte (MB90587)
- General-purpose ports
  - Up to 77 channels (Input pull-up resistor settable for: 24 channels. Output open drain settable for: 8 channels)
- IEBus™ controller\*
  - Three different data transfer rates selectable
    - Mode 0: 3.9 Kbps (16 bytes/frame)
    - Mode 1: 17.0 Kbps (32 bytes/frame)
    - Mode 2: 26.0 Kbps (128 bytes/frame)
  - \*: IEBus™ is a trademark of NEC Corporation.
- A/D Converter (RC) : 8 ch
  - 8/10-bit resolution
  - Conversion time: 34.7 μs (Min.) , 12 MHz operation
- D/A Converter: 2 ch
  - 8-bit resolutions
  - Setup time: 12.5 μs
- UART : 5 ch
- 8/16 bit PPG : 1 ch
  - 8 bits × 2 channels: 16 bits × 1 channel: Mode switching function provided
- 16 bit reload timer: 3 ch
- 16-bit PWC timer: 1 channel
  - Noise filter provided. Available to pulse width counter
- 16 bit I/O timer
  - Input capture : 4 ch
  - Output compare : 2 ch
  - Free run timer: 1 ch
- Internal clock generator
- Time-base counter/watchdog timer: 18-bit

(Continued)

*(Continued)*

- Clock monitor function integrated
- Low-power consumption mode
  - Sleep mode
  - Stop mode
  - Hardware standby mode
  - CPU intermittent operation mode
- Package: LQFP-100 / QFP-100
- CMOS technology

## ■ PRODUCT LINEUP

Part number Item	MB90587	MB90583B	MB90F583B	MB90V580B
Classification	Mass-produced products (MASK ROM)		Mass-produced products (Flash ROM)	Development/ evaluation product
ROM size	64 Kbytes	128 Kbytes	128 Kbytes	None
RAM size	4 Kbytes	6 Kbytes	6 Kbytes	6 Kbytes
Emulator-specific power supply *1	—	—	—	None
CPU functions	The number of instructions: 340 Instruction bit length: 8 bits, 16 bits Instruction length: 1 byte to 7 bytes Data bit length: 1 bit, 8 bits, 16 bits Minimum execution time: 62.5 ns (at machine clock of 16 MHz) Interrupt processing time: 1.5 ms (at machine clock of 16 MHz, minimum value)			
Ports	General-purpose I/O ports (CMOS output) : 45 General-purpose I/O port (Can be set as open-drain) : 8 General-purpose I/O ports (Input pull-up resistors available) : 24 Total: : 77			
IEBus™ controller	None	Communication mode: Half-duplex, asynchronous communication Multi-master system Access control: CDMA/CD Three modes selectable for different transmission speeds Transmit buffer: 8-byte FIFO buffer Receive buffer: 8-byte FIFO buffer		
Timebase timer	18-bit counter Interrupt interval: 1.024 ms, 4.096 ms, 16.384 ms, 131.072 ms (At oscillation of 4 MHz)			
Watchdog timer	Reset generation interval: 3.58 ms, 14.33 ms, 57.23 ms, 458.75 ms (at oscillation of 4 MHz, minimum value)			
Clock timer	15-bit counter Interrupt interval: 1 s, 0.5 s, 0.25 s, 31.25 ms (At oscillation of 32.768 kHz)			
8/16-bit PPG timer	Number of channels: 1 (8-bit × 2 channels) PPG operation of 8-bit or 16-bit A pulse wave of given intervals and given duty ratios can be output. Pulse interval: 62.5 ns to 1 ms (at oscillation of 4 MHz, machine clock of 16 MHz)			
16-bit reload timer	Number of channels: 3 Event count provided Interval: 125 ns to 131 ms (at oscillation of 4 MHz, machine clock of 16 MHz)			
PWC timer	Number of channels: 1 Timer function (select the counter timer from three internal clocks.) Pulse width measuring function (select the counter timer from three internal clocks.)

Part number		MB90587	MB90583B	MB90F583B	MB90V580B
Item					
16-bit I/O timer	16-bit free run timer	Number of channels: 1 Overflow interrupts			
	Output compare (OCU)	Number of channels: 2 Pin input factor: A match signal of compare register			
	Input capture (ICU)	Number of channels: 4 Rewriting a register value upon a pin input (rising, falling, or both edges)			
DTP/external interrupt circuit		Number of inputs: 8 Started by a rising edge, a falling edge, an "H" level input, or an "L" level input. External interrupt circuit or extended intelligent I/O service (EI <sup>2</sup> OS) can be used.			
Delayed interrupt generation module		An interrupt generation module for switching tasks used in real time operating systems.			
UART0, 1, 2, 3, 4		Clock synchronized transmission (62.5 Kbps to 1 Mbps) Clock asynchronized transmission (1202 bps to 9615 bps) Transmission can be performed by bi-directional serial transmission or by master/slave connection.			
A/D converter		Resolution: 8/10-bit changeable Number of inputs: 8 One-shot conversion mode (converts selected channel only once) Scan conversion mode (converts two or more successive channels and can program up to 8 channels.) Continuous conversion mode (converts selected channel repeatedly) Stop conversion mode (converts selected channel and stop operation repeatedly)			
D/A converter		8-bit resolution Number of channels: 2 channels Based on the R-2R system			
Low-power consumption (standby) mode		Sleep/stop/CPU intermittent operation/clock timer/hardware standby			
Process		CMOS			
Power supply voltage for operation*		4.5 V to 5.5 V *2			

\*1 : It is setting of DIP switch S2 when Emulation pod (MB2145-507) is used.

Please refer to the MB2145-507 hardware manual (2.7 Emulator-specific Power Pin) about details.

\*2 : Varies with conditions such as the operating frequency (See section "■ ELECTRICAL CHARACTERISTICS").

Assurance for the MB90V580B is given only for operation with a tool at a power supply voltage of 4.5 V to 5.5 V, an operating temperature of 0 to +25 °C, and an operating frequency of 1 MHz to 16 MHz.

## ■ DIFFERENCES AMONG PRODUCTS

### Memory Size

In evaluation with an evaluation product, note the difference between the evaluation product and the product actually used. The following items must be taken into consideration.

- The MB90V580B does not have an internal ROM, however, operations equivalent to chips with an internal ROM can be evaluated by using a dedicated development tool, enabling selection of ROM size by settings of the development tool.
- In the MB90V580B, images from FF4000<sub>H</sub> to FFFFFFF<sub>H</sub> are mapped to bank 00, and FE0000<sub>H</sub> to FF3FFF<sub>H</sub> to mapped to bank FE and FF only. (This setting can be changed by configuring the development tool.)
- In the MB90583B/587/F583B, images from FF4000<sub>H</sub> to FFFFFFF<sub>H</sub> are mapped to bank 00, and FF0000<sub>H</sub> to FF3FFF<sub>H</sub> to bank FF only.

### IEBus™ Controller

- MB90587 does not have an IEBus™ Controller.

## ■ PIN DESCRIPTION

Pin no.		Pin name	Circuit type	Function
QFP*1	LQFP*2			
82	80	X0	A	Oscillator pin
83	81	X1	A	Oscillator pin
52	50	$\overline{\text{HST}}$	C	Hardware standby input pin
77	75	$\overline{\text{RST}}$	B	Reset input pin
85 to 92	83 to 90	P00 to P07	D (CMOS/H)	General-purpose I/O ports. A pull-up resistor can be assigned (RD07 to RD00="1") by the pull-up resistor setting register (RDR0). [These pins are disabled with the output setting (DDR0 register: D07 to D00="1").]
		AD00 to AD07		In external bus mode, the pins function as the lower data I/O or lower address outputs (AD00 to AD07).
93 to 100	91 to 98	P10 to P17	F (CMOS/H)	General-purpose I/O ports. A pull-up resistor can be assigned (RD17 to RD10="1") by the pull-up resistor setting register (RDR1). [These pins are disabled with the output setting (DDR1 register: D17 to D10="1").]
		AD08 to AD15		In 16-bit external bus mode, the pins function as the upper data I/O or middle address outputs (AD08 to AD15).
1 to 8	99,100, 1 to 6	P20 to P27	F (CMOS/H)	General-purpose I/O ports In external bus mode, pins for which the corresponding bit in the HACR register is "1" function as the A16 to A23 pins.
		A16 to A23		In external bus mode, pins for which the corresponding bit in the HACR register is "1" function as the upper address output pins (A16 to A23).
9	7	P30	F (CMOS/H)	General-purpose I/O port Functions as the ALE pin in external bus mode.
		ALE		Functions as the address latch enable signal pin (ALE) in external bus mode.
10	8	P31	F (CMOS/H)	General-purpose I/O port Functions as the $\overline{\text{RD}}$ pin in external bus mode.
		$\overline{\text{RD}}$		Functions as the read strobe output pin ( $\overline{\text{RD}}$ ) in external bus mode.
12	10	P32	F (CMOS/H)	General-purpose I/O port Functions as the $\overline{\text{WRL}}$ pin in external bus mode if the WRE bit is "1".
		$\overline{\text{WRL}}$		Functions as the lower data write strobe output pin ( $\overline{\text{WRL}}$ ) in external bus mode.
13	11	P33	F (CMOS/H)	General-purpose I/O port Functions as the $\overline{\text{WRH}}$ pin in 16-bit external bus mode if the WRE bit in the EPCR register is "1"
		$\overline{\text{WRH}}$		Functions as the upper data write strobe output pin ( $\overline{\text{WRH}}$ ) in external bus mode.

# MB90580B Series

Pin no.		Pin name	Circuit type	Function
QFP*1	LQFP*2			
14	12	P34	F (CMOS/H)	General-purpose I/O port Functions as the HRQ pin in external bus mode if the HDE bit in the EPCR register is "1".
		HRQ		Functions as the hold request input pin (HRQ) in external bus mode.
15	13	P35	F (CMOS/H)	General-purpose I/O port Functions as the HAK pin in external bus mode if the HDE bit in the EPCR register is "1".
		$\overline{\text{HAK}}$		Functions as the hold acknowledge output pin ( $\overline{\text{HAK}}$ ) in external bus mode.
16	14	P36	F (CMOS/H)	General-purpose I/O port Functions as the RDY pin in external bus mode if the RYE bit in the EPCR register is "1".
		RDY		Functions as the external ready input pin (RDY) in external bus mode.
17	15	P37	F (CMOS/H)	General-purpose I/O port Functions as the CLK pin in external bus mode if the CKE bit in the EPCR register is "1".
		CLK		Functions as the machine cycle clock output pin (CLK) in external bus mode.
18	16	P40	E (CMOS/H)	General-purpose I/O port. This pin serves as an open-drain output port with OD40 in the open-drain control setting register (ODR4) set to "1". [The pin is disabled with the input setting (DDR4 register: D40="0").]
		SIN0		UART0 serial data input (SIN0) pin. When UART0 is operating for input, this input is used as required and thus the output from any other function to the pin must be off unless used intentionally.
19	17	P41	E (CMOS/H)	General-purpose I/O port. This pin serves as an open-drain output port with OD41 in the open-drain control setting register (ODR4) set to "1". [The pin is disabled with the input setting (DDR4 register: D41="0").]
		SOT0		UART0 serial data output pin (SOT0). This pin is enabled with the UART0 serial data output enabled.
20	18	P42	E (CMOS/H)	General-purpose I/O port. This pin serves as an open-drain output port with OD42 in the open-drain control setting register (ODR4) set to "1". [The pin is disabled with the input setting (DDR4 register: D42="0").]
		SCK0		UART0 serial clock I/O pin (SCK0). This pin is enabled with the UART0 clock output enabled.

Pin no.		Pin name	Circuit type	Function
QFP*1	LQFP*2			
21	19	P43	E (CMOS/H)	General-purpose I/O port. This pin serves as an open-drain output port with OD43 in the open-drain control setting register (ODR4) set to "1". [The pin is disabled with the input setting (DDR4 register: D43="0").]
		SIN1		UART1 serial data input (SIN1) pin. When UART1 is operating for input, this input is used as required and thus the output from any other function to the pin must be off unless used intentionally.
22	20	P44	E (CMOS/H)	General-purpose I/O port. This pin serves as an open-drain output port with OD44 in the open-drain control setting register (ODR4) set to "1". [The pin is disabled with the input setting (DDR4 register: D44="0").]
		SOT1		UART1 serial data output pin (SOT1). This pin is enabled with the UART1 serial data output enabled.
24	22	P45	E (CMOS/H)	General-purpose I/O port. This pin serves as an open-drain output port with OD45 in the open-drain control setting register (ODR4) set to "1". [The pin is disabled with the input setting (DDR4 register: D45="0").]
		SCK1		UART1 serial clock I/O pin (SCK1). This pin is enabled with the UART1 clock output enabled.
25	23	P46	E (CMOS/H)	General-purpose I/O port. This pin serves as an open-drain output port with OD46 in the open-drain control setting register (ODR4) set to "1". [The pin is disabled with the input setting (DDR4 register: D46="0").]
		ADTG		External trigger input pin (ADTG) for the A/D converter.
26	24	P47	E (CMOS/H)	General-purpose I/O port. This pin serves as an open-drain output port with OD47 in the open-drain control setting register (ODR4) set to "1". [The pin is disabled with the input setting (DDR4 register: D47="0").]
38	36	P50	G (CMOS/H)	General-purpose I/O port.
		AN0		Analog input pin (AN0) for use during A/D converter operation.
		SIN3		UART3 serial data input pin (SIN3). When UART3 is operating for input, this input is used as required and thus the output from any other function to the pin must be off unless used intentionally.
39	37	P51	G (CMOS/H)	General-purpose I/O port.
		AN1		Analog input pin (AN1) for use during A/D converter operation.
		SOT3		UART3 serial data output pin (SOT3). This pin is enabled with the UART3 serial data output enabled.

Pin no.		Pin name	Circuit type	Function
QFP*1	LQFP*2			
62	60	P63	D (CMOS/H)	General-purpose I/O port. A pull-up resistor can be assigned (RD63="1") by the pull-up resistor setting register (RDR6). [This pin is disabled with the output setting (DDR6 register: D63="1").]
		PPG1		The pin serves as the PPG1 output when PPGs are enabled.
63	61	P64	D (CMOS/H)	General-purpose I/O port. A pull-up resistor can be assigned (RD64="1") by the pull-up resistor setting register (RDR6). [This pin is disabled with the output setting (DDR6 register: D64="1").]
		PPG0		The pin serves as the PPG0 output when PPGs are enabled.
64	62	P65	D (CMOS/H)	General-purpose I/O port. A pull-up resistor can be assigned (RD65="1") by the pull-up resistor setting register (RDR6). [This pin is disabled with the output setting (DDR6 register: D65="1").]
		CKOT		This pin serves as the CKOT output during CKOT operation.
65	63	TX*3	I	This pin serves as the IEBus™ output.
66	64	RX*3	J (CMOS)	This pin serves as the IEBus™ input.
67 to 69	65 to 67	P90 to P92	F (CMOS/H)	General-purpose I/O port.
		TIN0 to TIN2		Event input pins for reload timers 0, 1, and 2. During reload timer input, these inputs are used continuously and thus the output from any other function to the pins must be avoided unless used intentionally.
		IN0 to IN2		Trigger inputs for input capture channels 0 to 2
70	68	P93	F (CMOS/H)	General-purpose I/O port.
		TOT0		Reload timer output pin. This function is applied when the output for reload timer 0 is enabled.
		IN3		Trigger inputs for input capture channel 3.
71, 72	69, 70	P94, P95	F (CMOS/H)	General-purpose I/O port.
		TOT1, TOT2		Reload timer output pins. This function is applied when the output for reload timer 1 and 2 are enabled.
		OUT0, OUT1		Event output for channel 0 and 1 of the output compare
73	71	P96	F (CMOS/H)	General-purpose I/O port.
		PWC		This pin serves as the PWC input with the PWC timer enabled.

## ■ HANDLING DEVICES

### 1. Preventing Latchup

CMOS ICs may cause latchup in the following situations:

- When a voltage higher than  $V_{CC}$  or lower than  $V_{SS}$  is applied to input or output pins.
- When a voltage exceeding the rating is applied between  $V_{CC}$  and  $V_{SS}$ .
- When  $AV_{CC}$  power is supplied prior to the  $V_{CC}$  voltage.

If latchup occurs, the power supply current increases rapidly, sometimes resulting in thermal breakdown of the device. Use meticulous care not to let it occur.

For the same reason, also be careful not to let the analog power-supply voltage exceed the digital power-supply voltage.

### 2. Handling unused input pins

Unused input pins left open may cause abnormal operation, or latch-up leading to permanent damage. Unused input pins should be pulled up or pulled down through at least 2 k $\Omega$  resistance.

Unused input/output pins may be left open in output state, but if such pins are in input state they should be handled in the same way as input pins.

### 3. Treatment of the TX and RX pins with the IEBus™ unused

When the IEBus is not used, connect a pull-down resistor to the TX pin and a pull-down/pull-up resistor to the RX pin.

### 4. Use of the subclock mode and external clock

Even when the subclock mode is not used, connect an oscillator to the X0A or X1A pin.

When the device uses an external clock, drive only the X0 pin while leaving the X1 pin open (See the illustration below).

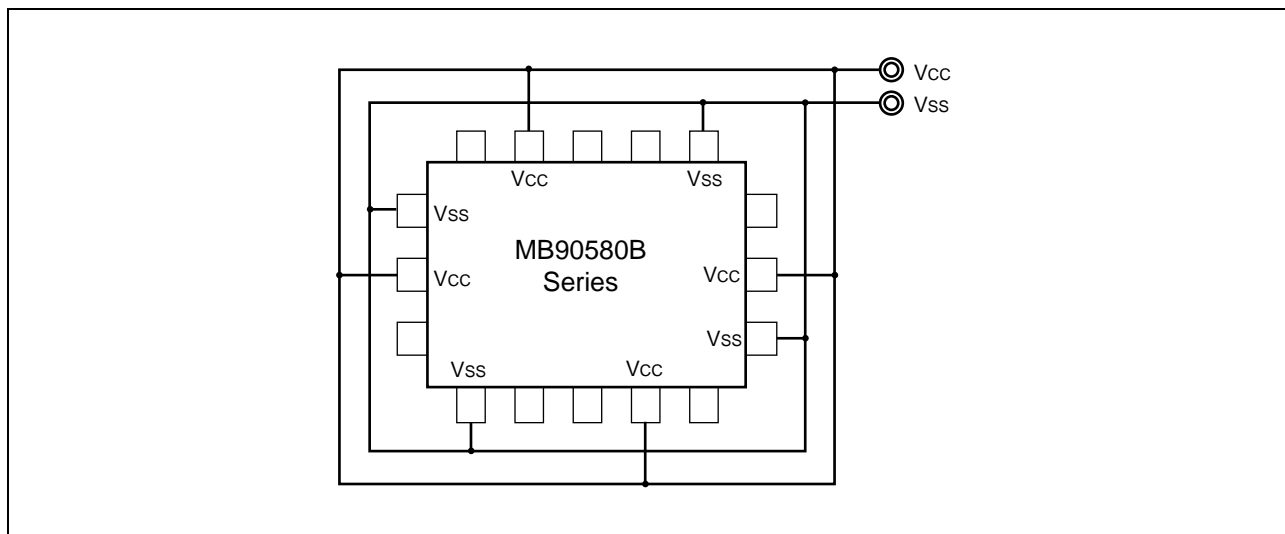

### 5. Power Supply Pins ( $V_{CC}/V_{SS}$ )

In products with multiple  $V_{CC}$  or  $V_{SS}$  pins, the pins of a same potential are internally connected in the device to avoid abnormal operations including latch-up. However, connect the pins external power and ground lines to lower the electro-magnetic emission level to prevent abnormal operation of strobe signals caused by the rise in the ground level, and to conform to the total current rating.

Make sure to connect  $V_{CC}$  and  $V_{SS}$  pins via lowest impedance to power lines.

# MB90580B Series

It is recommended to provide a bypass capacitor of around 0.1  $\mu\text{F}$  between  $V_{\text{CC}}$  and  $V_{\text{SS}}$  pin near the device.

## 6. Crystal Oscillator Circuit

Noises around X0 or X1 pins may be possible causes of abnormal operations. Make sure to provide bypass capacitors via shortest distance from X0, X1 pins, crystal oscillator (or ceramic resonator) and ground lines, and make sure, to the utmost effort, that lines of oscillation circuit not cross the lines of other circuits.

It is highly recommended to provide a printed circuit board art work surrounding X0 and X1 pins with an grand area for stabilizing the operation.

## 7. Turning-on Sequence of Power Supply to A/D Converter and Analog Inputs

Make sure to turn on the A/D converter power supply ( $AV_{\text{CC}}$ ,  $AV_{\text{SS}}$ ,  $AV_{\text{RH}}$ ,  $AV_{\text{RL}}$ ) and analog inputs (AN0 to AN7) after turning-on the digital power supply ( $V_{\text{CC}}$ ).

Turn-off the digital power after turning off the A/D converter supply and analog inputs. In this case, make sure that the voltage of  $AV_{\text{RH}}$  dose not exceed  $AV_{\text{CC}}$  (turning on/off the analog and digital power supplies simulta-  
neously is acceptable).

## 8. Connection of Unused Pins of A/D Converter

Connect unused pin of A/D converter to  $AV_{\text{CC}} = V_{\text{CC}}$ ,  $AV_{\text{SS}} = AV_{\text{RH}} = AV_{\text{RL}} = V_{\text{SS}}$ .

## 9. Connection of Unused Pins of D/A Converter

Connect unused pin of D/A converter to  $DV_{\text{RH}} = V_{\text{SS}}$ ,  $DV_{\text{SS}} = V_{\text{SS}}$ .

## 10. N.C. Pin

The N.C. (internally connected) pin must be opened for use.

## 11. Notes on Energization

To prevent the internal regulator circuit from malfunctioning, set the voltage rise time during energization at 50  $\mu\text{s}$  or more (0.2 V to 2.7 V).

## 12. Indeterminate outputs from ports 0 and 1

The outputs from ports 0 and 1 become indeterminate during a power-on reset after the power is turned on. Pay attention to the port output timing shown as follow.

## 13. Initialization

In the device, there are internal registers which are initialized only by a power-on reset. To initialize these registers turning on the power again.

## 14. Return from standby state

If the power-supply voltage goes below the standby RAM holding voltage in the standby state, the device may fail to return from the standby state. In this case, reset the device via the external reset pin to return to the normal state.

## 15. Precautions for Use of 'DIV A, Ri,' and 'DIVW A, RWi' Instructions

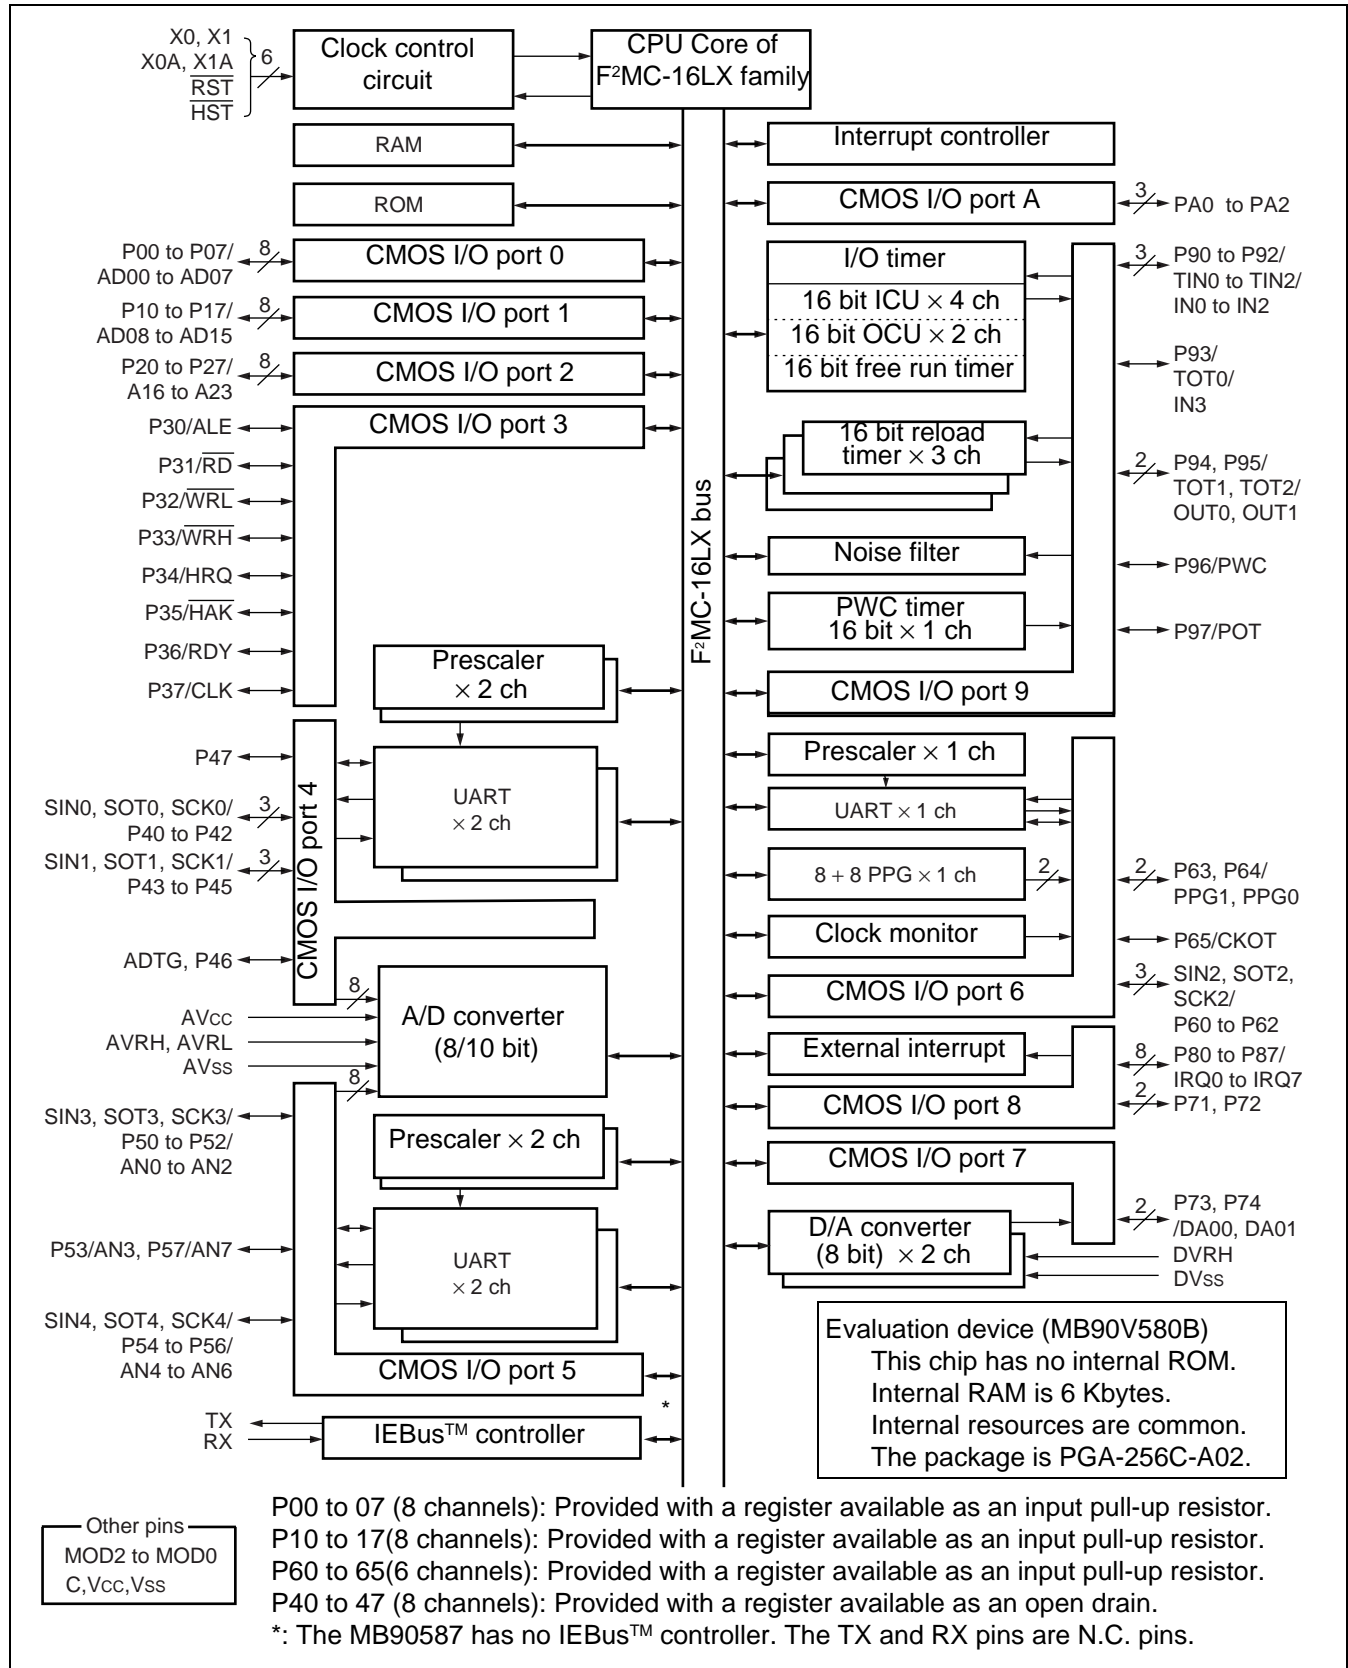

The signed multiplication-division instructions 'DIV A, Ri,' and 'DIVW A, RWi' should be used when the corresponding bank registers (DTB, ADB, USB, SSB) are set to value '00h.' If the corresponding bank registers (DTB, ADB, USB, SSB) are set to a value other than '00h,' then the remainder obtained after the execution of the instruction will not be placed in the instruction operand register.

## 16. Precautions for Use of REALOS

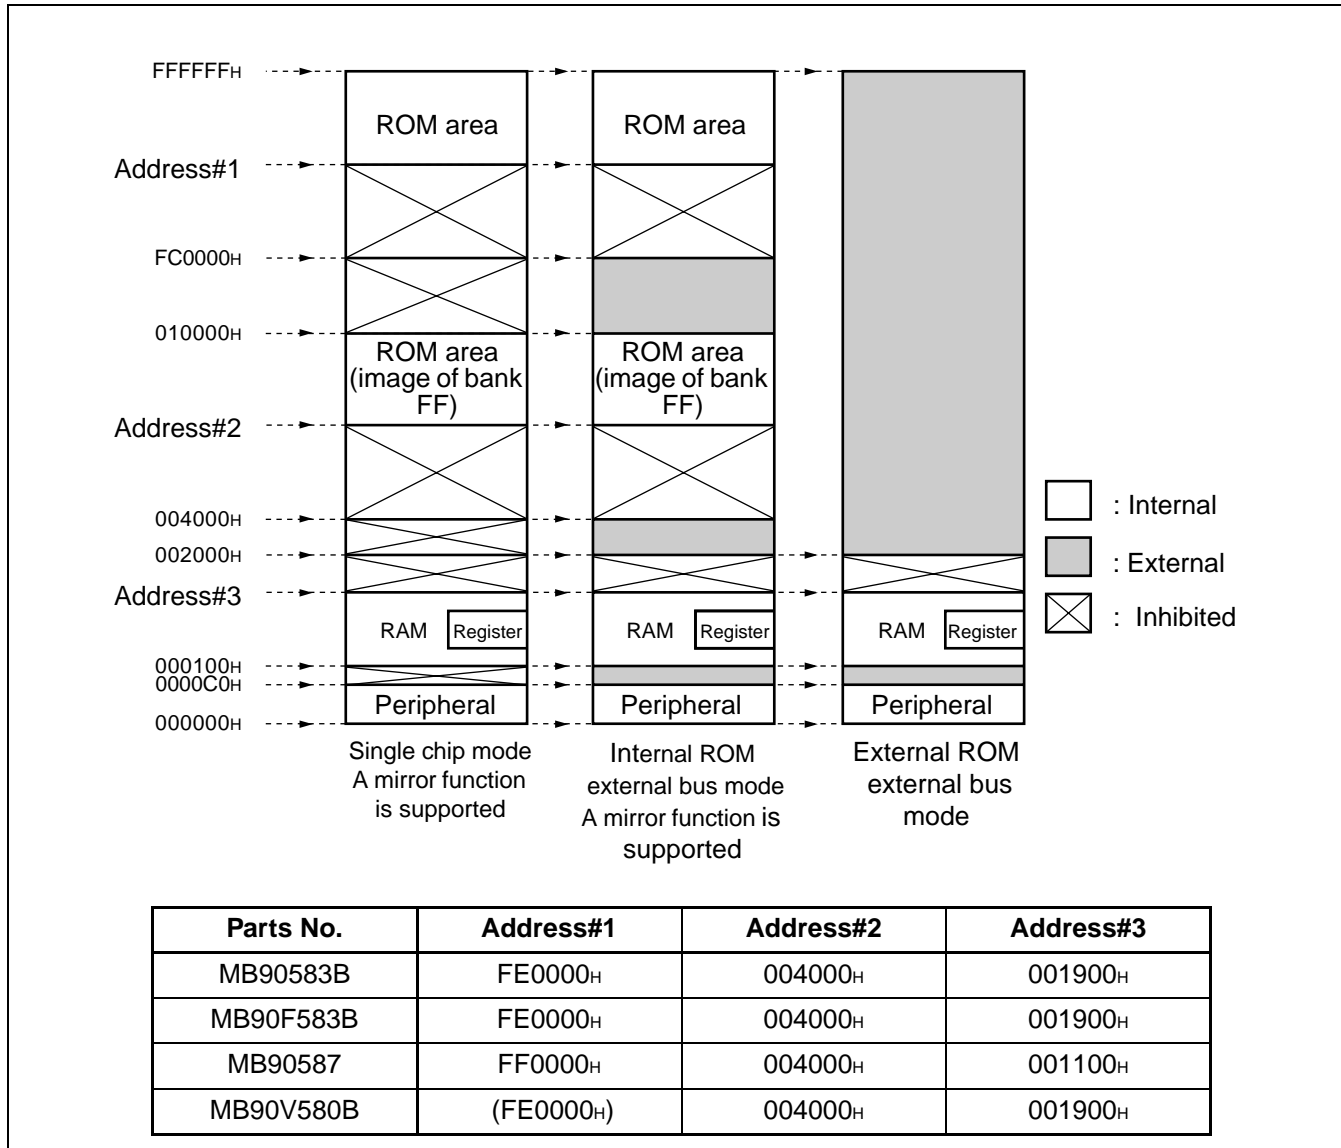

Extended intelligent I/O service (EI<sup>2</sup>OS) cannot be used, when REALOS is used.

# MB90580B Series

## ■ BLOCK DIAGRAM

## MEMORY MAP

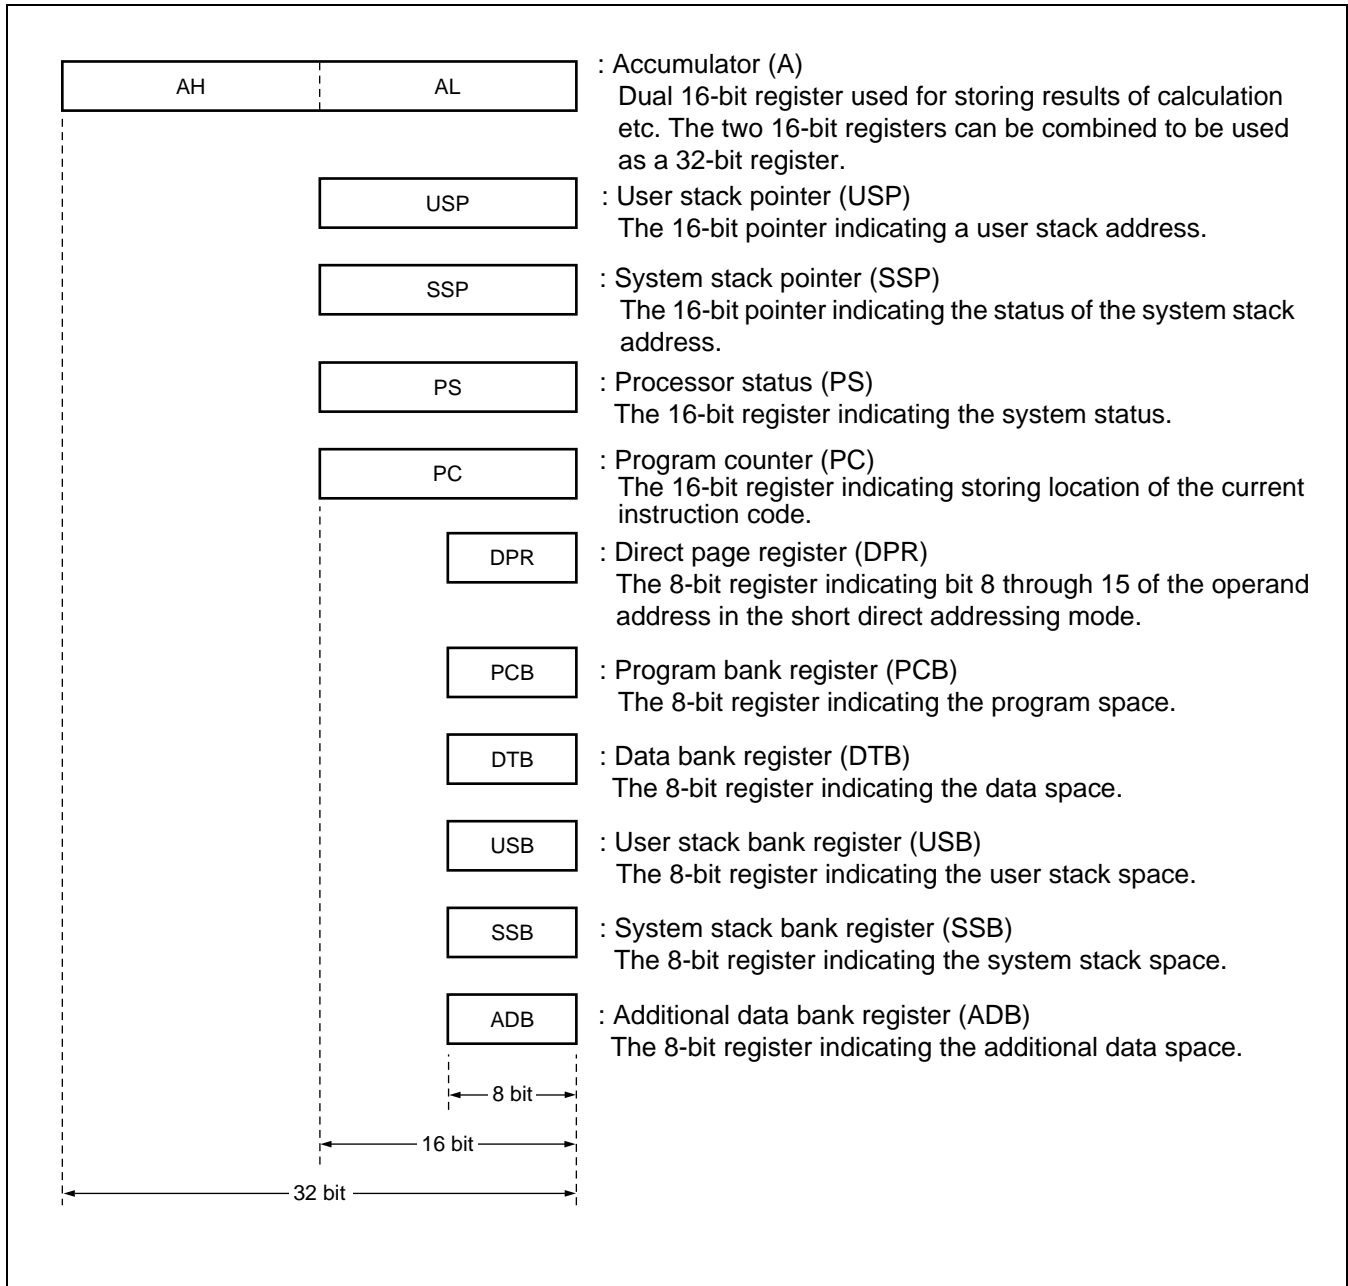

Note: The ROM data of bank FF is reflected in the upper address of bank 00, realizing effective use of the C compiler small model. The lower 16-bit is assigned to the same address, enabling reference of the table on the ROM without stating "far". For example, if an attempt has been made to access 00C000<sub>H</sub>, the contents of the ROM at FFC000<sub>H</sub> are accessed actually. Since the ROM area of the FF bank exceeds 48 Kbytes, the whole area cannot be reflected in the image for the 00 bank. The ROM data at FF4000<sub>H</sub> to FFFFFFF<sub>H</sub> looks, therefore, as if it were the image for 004000<sub>H</sub> to 00FFFF<sub>H</sub>. Thus, it is recommended that the ROM data table be stored in the area of FF4000<sub>H</sub> to FFFFFFF<sub>H</sub>.

1FF6 <sub>H</sub> to 1FFF <sub>H</sub>	(Reserved area)				

- Explanation of initial values→“0” : initial value“0” / “1” : initial value“1” / “X” : undefined / “-” : undefined (not used)
- The addresses following 00FF<sub>H</sub> are reserved. No external bus access signal is generated.
- Boundary #<sub>H</sub> between the RAM area and the reserved area varies with the product model.

Note: For bits that is initialized by a reset operation, the initial value set by the reset operation is listed as an initial value. Note that the values are different from reading results. For LPMCR/CKSCR/WDTC, there are cases where initialization is performed or not performed, depending on the types of the reset. However initial value for resets that initializes the value are listed.

## ■ PERIPHERAL RESOURCES

### 1. I/O Ports

#### (1) Outline of I/O ports

When a data register serving for control output is read, the data output from it as a control output is read regardless of the value in the direction register. Note that, if a read modify write instruction (such as a bit set instruction) is used to preset output data in the data register when changing its setting from input to output, the data read is not the data register latched value but the input data from the pin.

Ports 0 to 4 and 6 to A are input/output ports which serve as inputs when the direction register value is "0" or as outputs when the value is "1".

On the MB90580B series, ports 0 to 3 also serve as external bus pins. When the device is used in external bus mode, therefore, these ports are restricted on use.

Ports 2 and 3 can be used as ports even in external bus mode depending on the setting of the corresponding function select bit.

#### (2) Register configuration

- Port 0 data register (PDR0)

bit	15	.....	8	7	6	5	4	3	2	1	0
Address	: 000000H

## 2. Timebase Timer

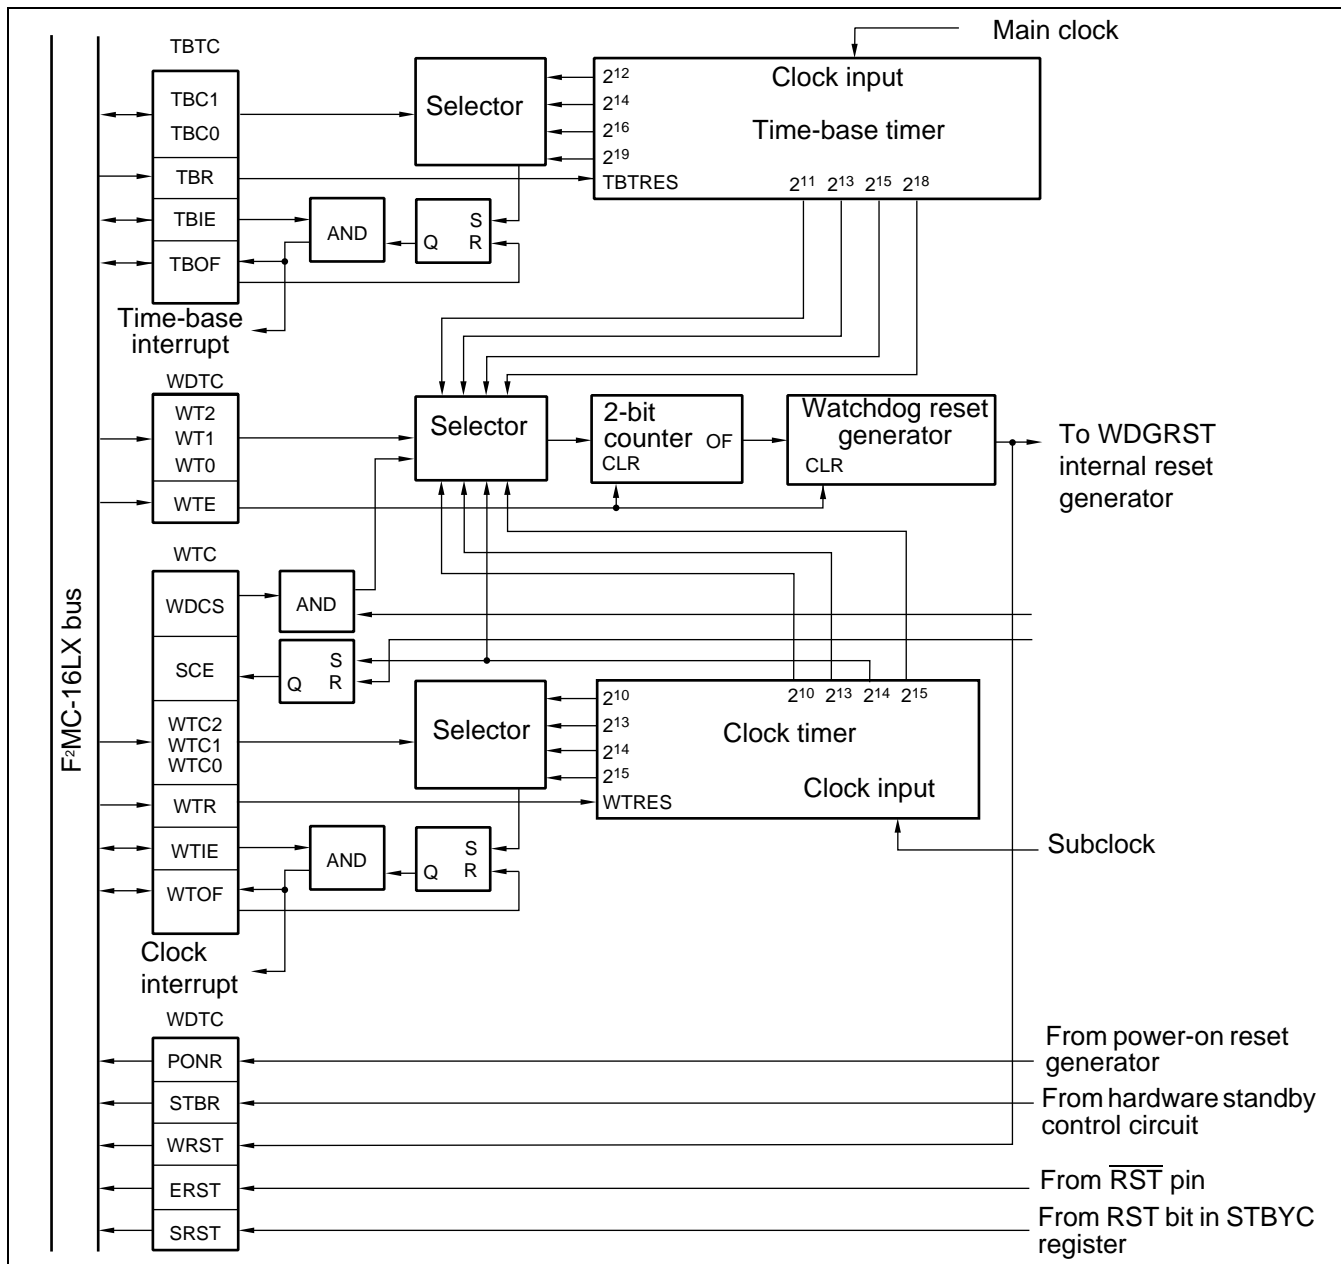

The time-base timer consists of a 18-bit timer and an interval interrupt control circuit. Note that the time-base timer uses the oscillation clock regardless of the setting of the MCS bit in the CKSCR.

### (1) Register configuration

- Timebase timer control register

bit	15	14	13	12	11	10	9	8	...	...	TBTC
Address	: 0000A9 <sub>H</sub>										
Access	(R/W)	(—)	(—)	(R/W)	(R/W)	(W)	(R/W)	(R/W)	...	...	
Initial value	(1)	(—)	(—)	(0)	(0)	(1)	(0)	(0)	...	...	

### (2) Block Diagram

## 3. Watchdog Timer

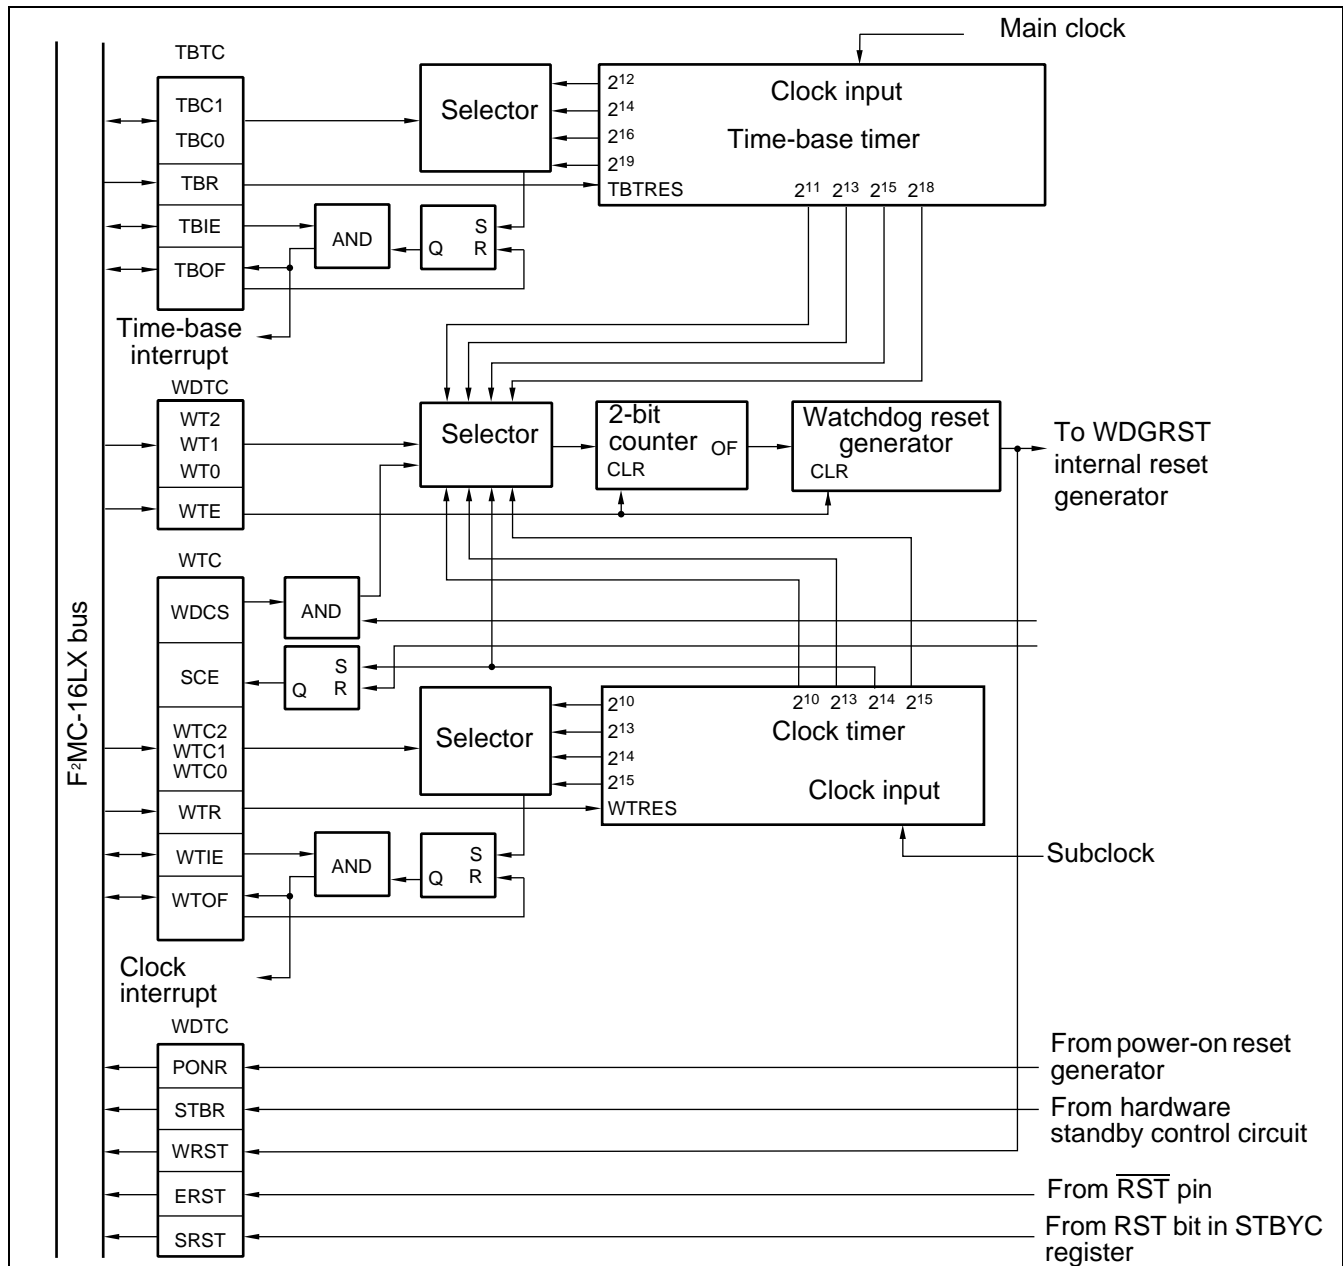

The watchdog timer consists of a 2-bit watchdog counter using carry signals from the 18-bit time-base timer as the clock source, a control register, and a watchdog reset control section.

### (1) Register configuration

- Watchdog timer control register

Address	bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0	
: 0000A8 <sub>H</sub>	PONR	STBR	WRST	ERST	SRST	WTE	WT1	WT0	WDTC
Access	(R)	(R)	(R)	(R)	(R)	(W)	(W)	(W)	
Initial value	(X)	(X)	(X)	(X)	(X)	(1)	(1)	(1)	

### (2) Block Diagram

# MB90580B Series

## 4. Clock timer

The clock timer has the functions of a watchdog timer clock source, a subclock oscillation settling time wait timer, and of a periodically interrupt generating interval timer.

### (1) Register configuration

- Clock timer control register

Address	bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0	
: 0000AA <sub>H</sub>	WDCS	SCE	WTIE	WTOF	WTR	WTC2	WTC1	WTC0	WTC
Access	(R/W)	(R)	(R/W)	(R/W)	(R/W)	(R/W)	(R/W)	(R/W)	
Initial value	(1)	(X)	(0)	(0)	(0)	(0)	(0)	(0)	

### (2) Block Diagram

## 5. External Memory Access (External Bus Pin Control Circuit)

The external bus pin control circuit controls external bus pins used to expand the address/data buses of the CPU outside.

### (1) Register configuration

- Automatic ready function selection register

bit	15	14	13	12	11	10	9	8	
Address	: 0000A5 <sub>H</sub>								ARSR
	IOR1	IOR0	HMR1	HMR0	—	—	LMR1	LMR0	
Access	(W)	(W)	(W)	(W)	(—)	(—)	(W)	(W)

## 6. PWC Timer

The PWC (pulse width count) timer is a 16-bit multifunction up-counter with reload timer functions and input-signal pulse-width count functions as well.

The PWC timer consists of a 16-bit counter, a input pulse divider, a divide ratio control register, a count input pin, a pulse output pin, and a 16-bit control register.

### (1) Features of the PWC timer

The PWC timer has the following features:

- Timer functions

- Generates an interrupt request at set time intervals.

- Outputs pulse signals synchronized with the timer cycle.

- Selects the counter clock from among three internal clocks.

- Pulse-width count functions

- Counts the time between external pulse input events.

- Selects the counter clock from among three internal clocks.

- Count mode

- H pulse width (rising edge to falling edge)/L pulse width (falling edge to rising edge)

- Rising-edge cycle (rising edge to falling edge)/Falling-edge cycle (falling edge to rising edge)

- Count between edges (rising or falling edge to falling or rising edge)

- Capable of counting cycles by dividing input pulses by  $2^2$ ,  $2^4$ ,  $2^6$ ,  $2^8$  using an 8-bit input divider.

- Generates an interrupt request upon the completion of count operation.

- Selects single or consecutive count operation.

## (2) Register configuration

## (3) Block Diagram

## 7. 16-bit I/O timer

The 16-bit I/O timer module consists of one 16-bit free run timer, four input capture circuits, and two output comparators. This module allows two independent waveforms to be output on the basis of the 16-bit free run timer. Input pulse width and external clock periods can, therefore, be measured.

### (1) 16-bit free-run timer (1 channel)

The 16-bit free run timer consists of a 16-bit up-counter, a control register, and a prescaler. The value output from this timer/counter is used as the base time for the input capture and output compare modules.

- Counter operation clock (Selectable from among the following four)

Four internal clock cycles:  $\phi/4$ ,  $\phi/16$ ,  $\phi/64$ ,  $\phi/256$

$\phi$ : Machine clock

- Interrupts

An interrupt can be generated when the 16-bit free-run timer causes a counter overflow or by compare/match operation with compare register 0. (The compare/match operation requires the mode setting).

- Counter value

An interrupt can be generated when the 16-bit free-run timer causes a counter overflow or when a match with compare register 0 occurs (The compare/match function can be used by the appropriate mode setting).

- Initialization

The counter value can be initialized to "0000H" at a reset, soft clear operation, or a match with compare register 0.

### (2) Output compare module (2 channels)

The output compare module consists of two 16-bit compare registers, compare output latches, and control registers. When the 16-bit free-run timer value matches the compare register value, this module generates an interrupt while inverting the output level.

- Two compare registers can operate independently.

Output pin and interrupt flag for each compare register

- A pair of compare registers can be used to control the output pin.

Two compare registers can be used to invert the output pin polarity.

- The initial value for each output pin can be set.
- An interrupt can be generated by compare/match operation.

### (3) Input capture module (4 channels)

The input capture module consists of capture registers and control registers respectively associated with four independent external input pins. This module can hold the 16-bit free run timer value in the capture register. In addition, it can detect an arbitrary edge of the signal input from each external input pin to generate an interrupt.

- The external input signal edge to be detected can be selected.

One or both of the rising and falling edges can be selected.

- Four input capture channels can operate independently.
- An interrupt can be generated at a valid edge of the external input signal.

The extended intelligent I/O service can be activated by the interrupt by the input capture module.

## 9. 8/16-bit PPG

8/16-bit PPG is an 8/16-bit reload timer module. The block performs PPG output in which the pulse output is controlled by the operation of the timer.

The hardware consists of two 8-bit down-counters, four 8-bit reload registers, one 16-bit control register, two external pulse output pins, and two interrupt outputs. The PPG has the following functions.

- 8-bit PPG output in two channels independent operation mode:  
Two independent PPG output channels are available.
- 16-bit PPG output operation mode :  
One 16-bit PPG output channel is available.
- 8 + 8-bit PPG output operation mode :  
Variable-period 8-bit PPG output operation is available by using the output of channel 0 as the clock input to channel 1.
- PPG output operation :  
Outputs pulse waveforms with variable period and duty ratio. Can be used as a D/A converter in conjunction with an external circuit.

## 10. DTP/External Interrupts

The DTP (Data Transfer Peripheral) is a peripheral block that interfaces external peripherals to the F<sup>2</sup>MC-16LX CPU. The DTP receives DMA and interrupt processing requests from external peripherals and passes the requests to the F<sup>2</sup>MC-16LX CPU to activate the intelligent I/O service or interrupt processing. Two request levels ("H" and "L") are provided for the intelligent I/O service. For external interrupt requests, generation of interrupts on a rising or falling edge as well as on "H" and "L" levels can be selected, giving a total of four types.

### (1) Register configuration

- Interrupt/DTP enable register

bit	7	6	5	4	3	2	1	0	
Address : 0000030H	EN7	EN6	EN5	EN4	EN3	EN2	EN1	EN0	ENIR

### (2) Block Diagram

## 11. Delayed Interrupt Generation Module

The delayed interrupt generation module is used to generate the task switching interrupt. Interrupt requests to the F<sup>2</sup>MC-16LX CPU can be generated and cleared by software using this module.

### (1) Register configuration

The DIRR register controls generation and clearing of delayed interrupt requests. Writing “1” to the register generates a delayed interrupt request. Writing “0” to the register clears the delayed interrupt request. The register is set to the interrupt cleared state by a reset. Either “0” or “1” can be written to the reserved bits. However, considering possible future extensions, it is recommended that the set bit and clear bit instructions are used for register access.

- Delayed interrupt generation/release register

## 12. A/D Converter

The A/D converter converts analog input voltages to digital values. The A/D converter has the following features.

- Conversion time: Minimum of 34.7  $\mu$ s per channel (for a 12 MHz machine clock)
- Uses RC-type successive approximation conversion with a sample and hold circuit.
- 8/10-bit resolution
- Eight program-selectable analog input channels

Single conversion mode: Selectively convert one channel.

Scan conversion mode: Continuously convert multiple channels. Maximum of 8 program selectable channels.

Continuous conversion mode : Repeatedly convert specified channels.

Stop conversion mode: Convert one channel then halt until the next activation. (Enables synchronization of the conversion start timing.)

- An A/D conversion completion interrupt request.

An A/D conversion completion interrupt request to the CPU can be generated on the completion of A/D conversion. This interrupt can activate EI<sup>2</sup>OS to transfer the result of A/D conversion to memory and is suitable for continuous operation.

- Activation by software, external trigger (falling edge), or timer (rising edge) can be selected.

## 14. Communication Prescaler

The register (clock division control register) of the communication prescaler controls division of the machine clock frequency. It is designed to provide a fixed baud rate for a variety of machine clock frequencies depending on the user setting.

The output from the communication prescaler is used by the UARTs.

### (1) Register configuration

## 15. UART

The UART is a serial I/O port for asynchronous (start-stop) communication or clock-synchronous communication.

The UART has the following features:

- Full-duplex double buffering
- Capable of asynchronous (start-stop) and CLK-synchronous communications
- Support for the multiprocessor mode
- Dedicated baud rate generator integratedBaud rate

Operation	Baud rate
Asynchronous	31250/9615/4808/2404/1202 bps
CLK synchronous	2 M/1 M/500 K/250 K/125 K/62.5 Kbps

\* : Assuming internal machine clock frequencies of 6, 8, 10, 12, and 16 MHz

- Capable of setting an arbitrary baud rate using an external clock
- Error detection functions (parity, framing, overrun)
- HRz sign transfer signal

## 16. IEBus™ Controller

The IEBus™ (Inter-Equipment Bus) is a small-scale, two-wire serial bus interface designed for data transfer between pieces of equipment.

This interface is applicable, for example, as a bus interface for controlling vehicle-mounted devices.

### IEBus™ has the following features:

- Multitasking  
Any of the units connected to the IEBus™ can transmit data to another one.
- Broadcast function (Communication from one unit to multiple units)  
Group broadcast : Broadcast to a group of units  
All-unit broadcast : Broadcast to all units
- Three modes can be selected for different transmission speeds.

	IEBus™ internal frequency	
	6 MHz	6.29 MHz
Mode 0	About 3.9 Kbps	About 4.1 Kbps
Mode 1	About 17 Kbps	About 18 Kbps
Mode 2	About 26 Kbps	About 27 Kbps

- Data buffer for transmission  
8-byte FIFO buffer
- Data buffer for reception  
8-byte FIFO buffer
- CPU internal operating frequency (12 MHz, 12.58 MHz)
- Frequency tolerance  
In mode 0 or 1 :  $\pm 1.5\%$   
In mode 2 :  $\pm 0.5\%$

## (2) Block Diagram

The control circuit in the IEBus™ controller executes the following control functions:

- Controls the number of bytes in data to be transmitted and received.
- Controls the maximum number of bytes transmitted.
- Detects the results of arbitration.
- Evaluates the return of acknowledgment of each field.
- Generates interrupt signals.

## 17. Clock Monitor Function

The clock monitor function outputs the frequency-divided machine clock signal (for monitoring purposes) from the CKOT pin.

## 18. Address Match Detection Function

When an address matches the value set in the address detection register, the instruction code to be loaded into the CPU is forced to be replaced with the INT9 instruction code (01H). When executing a set instruction, the CPU executes the INT9 instruction. The address match detection function is implemented by processing using the INT9 interrupt routine.

The device contains two address detection registers, each provided with a compare enable bit. When the value set in the address detection register matches an address and the interrupt enable bit is "1", the instruction code to be loaded into the CPU is forced to be replaced with the INT9 instruction code.

### (1) Register configuration

## 19. ROM Mirroring Function Selection Module

The ROM mirroring function selection module can select what the FF bank allocated the ROM sees through the 00 bank according to register settings.

### (1) Register configuration

- ROM mirroring function selection register

### (2) Block Diagram

## 20. One-Megabit Flash Memory

The 1Mbit flash memory is allocated in the FE<sub>H</sub> to FF<sub>H</sub> banks on the CPU memory map. Like masked ROM, flash memory is read-accessible and program-accessible to the CPU using the flash memory interface circuit. The flash memory can be programmed/erased by the instruction from the CPU via the flash memory interface circuit. The flash memory can therefore be reprogrammed (updated) while still on the circuit board under integrated CPU control, allowing program code and data to be improved efficiently. Note that sector operations such as “enable sector protect” cannot be used.

Features of 1Mbit flash memory

- 128K words x 8 bits or 64K words x 16 bits (16K + 512 x 2 + 7K + 8K + 32K + 64K) sector configuration
- Automatic program algorithm (Embedded Algorithm\*: Same as the MBM29F400TA)
- Erasure suspend/resume function integrated
- Detection of programming/erasure completion using the data polling or toggle bit
- Detection of programming/erasure completion using CPU interrupts
- Compatible with JEDEC standard commands
- Capable of erasing data sector by sector (arbitrary combination of sectors)
- Minimum number of times of programming/erasure: 100,000

\* : Embedded Algorithm is a trademark of Advanced Micro Devices, Inc.

## (2) Sector configuration of 1Mbit flash memory

The 1Mbit flash memory has the sector configuration illustrated below. The addresses in the illustration are the upper and lower addresses of each sector.

When accessed from the CPU, SA0 and SA1 to SA4 are allocated in the FE and FF bank registers, respectively.

Flash memory	CPU address	Programmer address *
SA4 (16 Kbytes)	FFFFFF <sub>H</sub>	7FFFF <sub>H</sub>
	FFC000 <sub>H</sub>	7C000 <sub>H</sub>
SA3 (8 Kbytes)	FFBFFF <sub>H</sub>	7BFFF <sub>H</sub>
	FFA000 <sub>H</sub>	7A000 <sub>H</sub>
SA2 (8 Kbytes)	FF9FFF <sub>H</sub>	79FFF <sub>H</sub>
	FF8000 <sub>H</sub>	78000 <sub>H</sub>
SA1 (32 Kbytes)	FF7FFF <sub>H</sub>	77FFF <sub>H</sub>
	FF0000 <sub>H</sub>	70000 <sub>H</sub>
SA0 (64 Kbytes)	FEFFFF <sub>H</sub>	6FFFF <sub>H</sub>
	FE0000 <sub>H</sub>	60000 <sub>H</sub>

\* : Programmer addresses correspond to CPU addresses when data is programmed in flash memory by a parallel programmer. Programmer addresses are used to program/erase data using a general-purpose programmer.

## 21. Low-Power Consumption Control Circuit

The operation modes of the MB90580B series are the PLL clock, PLL sleep, watch, main clock, main sleep, stop, and hardware standby modes. The operation modes excluding the PLL clock mode are classified as low-power consumption modes.

The low power consumption circuit has the following functions.

- Main clock mode/Main sleep mode

In either mode, the microcontroller operates only with the main clock (OSC oscillation clock), using the main clock as the operating clock while suspending the PLL clock (VCO oscillation clock).

- PLL sleep mode/Main sleep mode

These modes stop only the operation clock of the CPU, leaving the other clocks active.

- Watch mode

The watch mode allows only the time-base timer to operate.

- Stop mode/Hardware standby mode

These modes stop oscillation while retaining data at the lowest power consumption. The CPU intermittent operation function causes the clock supplied to the CPU to operate intermittently when the CPU accesses a register, internal memory, internal resource, or external bus. This function saves power consumption by decreasing the execution speed of the CPU while providing high-speed clock signals to the internal resources. The PLL clock multiplication factor can be selected from among 1, 2, 3, and 4 using the CS1 and CS0 bits in the clock selection register.

The WS1 and WS0 bits can be used to set the oscillation settling time for the main clock, which is taken to wake up from the stop or hardware standby mode.

### 1. Absolute Maximum Ratings

( $V_{SS} = AV_{SS} = 0.0\text{ V}$ )

Parameter	Symbol	Rating		Unit	Remarks
		Min.	Max.		
Power supply voltage	$V_{CC}$	$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	
	$AV_{CC}$	$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	$V_{CC} \geq AV_{CC}$ *1
	$AVRH, AVRL$	$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	$AV_{CC} \geq AVRH/L, AVRH \geq AVRL$
	$DV_{CC}$	$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	$V_{CC} \geq DV_{CC}$
Input voltage	$V_I$	$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	*2
Output voltage	$V_O$	$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	*2
"L" level maximum output current	$I_{OL}$	—	15	mA	*3
"L" level average output current	$I_{OLAV}$	—	4	mA	Average output current = operating current $\times$ operating efficiency
"L" level total maximum output current	$\Sigma I_{OL}$	—	100	mA	
"L" level total average output current	$\Sigma I_{OLAV}$	—	50	mA	Average output current = operating current $\times$ operating efficiency
"H" level maximum output current	$I_{OH}$	—	-15	mA	*3
"H" level average output current	$I_{OHAV}$	—	-4	mA	Average output current = operating current $\times$ operating efficiency
"H" level total maximum output current	$\Sigma I_{OH}$	—	-100	mA	
"H" level total average output current	$\Sigma I_{OHAV}$	—	-50	mA	Average output current = operating current $\times$ operating efficiency
Power consumption	$P_D$	—	300	mW	
Operating temperature	$T_A$	-40	+85	$^{\circ}\text{C}$	
Storage temperature	$T_{stg}$	-55	+150	$^{\circ}\text{C}$	

\*1 :  $AV_{CC}$  shall never exceed  $V_{CC}$  when power on.

\*2 :  $V_I$  and  $V_O$  shall never exceed  $V_{CC} + 0.3\text{ V}$ .

\*3 : The maximum output current is a peak value for a corresponding pin.

**WARNING:** Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

# MB90580B Series

## 2. Recommended Operating Conditions

( $V_{SS} = AV_{SS} = 0.0\text{ V}$ )

Parameter	Symbol	Value		Unit	Remarks
		Min.	Max.		
Power supply voltage	$V_{CC}$	3.0	5.5	V	Normal operation (MB90583B, MB90587, MB90V580)
		4.5	5.5	V	Normal operation (MB90F583B)
	$V_{CC}$	3.0	5.5	V	Retains status at the time of operation stop
"H" level input voltage	$V_{IH}$	$0.7 V_{CC}$	$V_{CC}+0.3$	V	CMOS input pin
	$V_{IHS}$	$0.8 V_{CC}$	$V_{CC}+0.3$	V	CMOS hysteresis input pin
	$V_{IHM}$	$V_{CC} - 0.3$	$V_{CC}+0.3$	V	MD pin input
"L" level input voltage	$V_{IL}$	$V_{SS} - 0.3$	$0.3 V_{CC}$	V	CMOS input pin
	$V_{ILS}$	$V_{SS} - 0.3$	$0.2 V_{CC}$	V	CMOS hysteresis input pin
	$V_{ILM}$	$V_{SS} - 0.3$	$V_{SS}+0.3$	V	MD pin input
Smoothing capacitor	$C_s$	0.1	1.0	$\mu\text{F}$	Use a ceramic capacitor or a capacitor with equivalent frequency characteristics. The smoothing capacitor to be connected to the $V_{CC}$ pin must have a capacitance value higher than $C_s$ .
Operating temperature	$T_A$	-40	+85	$^{\circ}\text{C}$	

• C pin connection circuit

**WARNING:** The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representatives beforehand.

## (2) Clock Output Timings

( $V_{CC} = 5.0\text{ V} \pm 10\%$ ,  $V_{SS} = AV_{SS} = 0.0\text{ V}$ ,  $T_A = -40\text{ }^\circ\text{C}$  to  $+85\text{ }^\circ\text{C}$ )

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
Clock cycle time	$t_{CYC}$	CLK	$V_{CC} = 5\text{ V} \pm 10\%$	62.5	—	ns	
CLK $\uparrow$ $\rightarrow$ CLK $\downarrow$	$t_{CHCL}$			20	—	ns	

## (3) Reset, Hardware Standby Input Timing

( $V_{CC} = 5.0\text{ V} \pm 10\%$ ,  $V_{SS} = AV_{SS} = 0.0\text{ V}$ ,  $T_A = -40\text{ }^\circ\text{C}$  to  $+85\text{ }^\circ\text{C}$ )

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
Reset input time	$t_{RSTL}$	$\overline{\text{RST}}$	—	$4 t_{CP}$	—	ns	
Hardware standby input time	$t_{HSTL}$	$\overline{\text{HST}}$		$4 t_{CP}$	—	ns	

# MB90580B Series

## (4) Power-on Reset

( $V_{CC} = 5.0\text{ V} \pm 10\%$ ,  $V_{SS} = AV_{SS} = 0.0\text{ V}$ ,  $T_A = -40\text{ }^\circ\text{C}$  to  $+85\text{ }^\circ\text{C}$ )

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
Power supply rising time	$t_R$	$V_{CC}$	—	0.05	30	ms	
Power supply cut-off time	$t_{OFF}$	$V_{CC}$	—	4	—	ms	Due to repeated operations

Note : -  $V_{CC}$  must be kept lower than 0.2 V before power-on.

- The above values are used for causing a power-on reset.
- If  $\overline{HST} = "L"$ , be sure to turn the power supply on using the above values to cause a power-on reset whether or not the power-on reset is required.
- Some registers in the device are initialized only upon a power-on reset. To initialize these registers, turn the power supply using the above values.

Sudden changes in the power supply voltage may cause a power-on reset. To change the power supply voltage while the device is in operation, it is recommended to raise the voltage smoothly to suppress fluctuations as shown below. In this case, change the supply voltage with the PLL clock not used. If the voltage drop is 1 mV or fewer per second, however, you can use the PLL clock.

Power supply current	$I_A$	$\text{AV}_{CC}$	—	5	—	mA	
	$I_{AH}$	$\text{AV}_{CC}$	—	—	5	$\mu\text{A}$	*
Reference voltage supply current	$I_R$	$\text{AVRH}$	—	400	—	$\mu\text{A}$	
	$I_{RH}$	$\text{AVRH}$	—	—	5	$\mu\text{A}$	*
Offset between channels	—	AN0 to AN7	—	—	4	LSB	

\* : The current when the A/D converter is not operating or the CPU is in stop mode (for  $V_{CC} = \text{AV}_{CC} = \text{AVRH} = 5.0\text{ V}$ )

Note: • The error increases proportionally as  $|\text{AVRH} - \text{AVRL}|$  decreases.

- The output impedance of the external circuits connected to the analog inputs should be in the following range.
- The output impedance of the external circuit : 15.5 k $\Omega$  (Max.) (Sampling time = 4.0  $\mu\text{s}$ )
- If the output impedance of the external circuit is too high, the sampling time might be insufficient.

## 6. A/D Converter Glossary

Resolution : Analog changes that are identifiable with the A/D converter

Linearity error : The deviation of the straight line connecting the zero transition point (“00 0000 0000” ↔ “00 0000 0001”) with the full-scale transition point (“11 1111 1110” ↔ “11 1111 1111”) from actual conversion characteristics

Differential linearity error : The deviation of input voltage needed to change the output code by 1 LSB from the theoretical value

Total error : The total error is defined as a difference between the actual value and the theoretical value, which includes zero-transition error/full-scale transition error and linearity error.

$$\text{Total error for digital output } N = \frac{V_{NT} - \{1 \text{ LSB} \times (N - 1) + 0.5 \text{ LSB}\}}{1 \text{ LSB}} \quad [\text{LSB}]$$

$$1 \text{ LSB} = (\text{Theoretical value}) \frac{AVRH - AVRL}{1024} \quad [\text{V}]$$

$$V_{OT}(\text{Theoretical value}) = AVRL + 0.5 \text{ LSB} \quad [\text{V}]$$

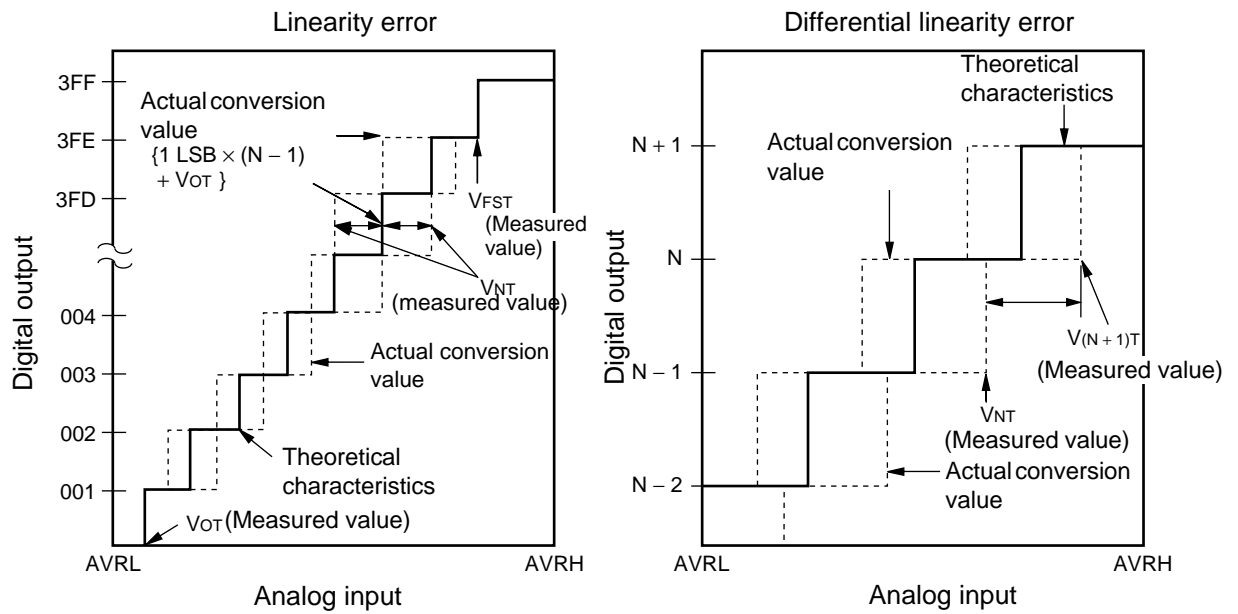

$$V_{FST}(\text{Theoretical value}) = AVRH - 1.5 \text{ LSB} \quad [\text{V}]$$

$V_{NT}$  : Voltage at a transition of digital output from (N - 1) to N

(Continued)

(Continued)

$$\text{Linearity error of digital output N} = \frac{V_{NT} - \{1 \text{ LSB} \times (N - 1) + V_{OT}\}}{1 \text{ LSB}} \quad [\text{LSB}]$$

$$\text{Differential linearity error of digital output N} = \frac{V_{(N+1)T} - V_{NT}}{1 \text{ LSB}} - 1 \text{ LSB} [\text{LSB}]$$

$$1 \text{ LSB} = \frac{V_{FST} - V_{OT}}{1022} \quad [\text{V}]$$

$V_{OT}$  : Voltage at transition of digital output from "000<sub>H</sub>" to "001<sub>H</sub>"  
 $V_{FST}$  : Voltage at transition of digital output from "3FE<sub>H</sub>" to "3FF<sub>H</sub>"

# MB90580B Series

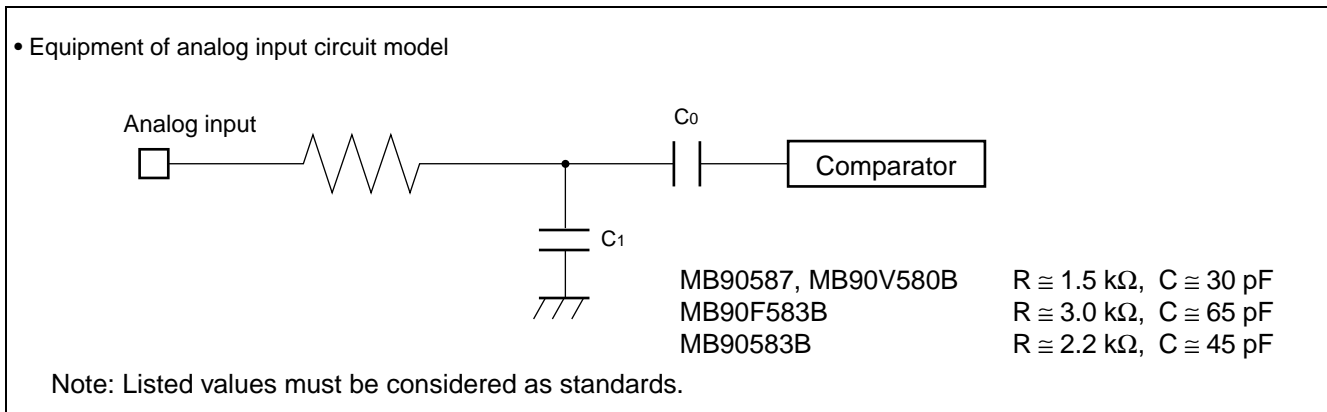

## 7. Notes on Using A/D Converter

Select the output impedance value for the external circuit of analog input according to the following conditions.

Output impedance values of the external circuit of 7 kΩ or lower are recommended.

When capacitors are connected to external pins, the capacitance of several thousand times the internal capacitor value is recommended to minimized the effect of voltage distribution between the external capacitor and internal capacitor.

When the output impedance of the external circuit is too high, the sampling period for analog voltages may not be sufficient (sampling period = 4.00 μs @ machine clock of 16 MHz)

• Error

The smaller the  $|AVRH - AVRL|$ , the greater the error would become relatively.

## 8. D/A Converter Electrical Characteristics

( $V_{CC} = AV_{CC} = 5.0 \text{ V} \pm 10\%$ ,  $V_{SS} = AV_{SS} = DV_{SS} = 0.0 \text{ V}$ ,  $T_A = -40 \text{ }^\circ\text{C}$  to  $+85 \text{ }^\circ\text{C}$ )

Parameter	Symbol	Pin name	Value			Unit	Remarks

## ■ INSTRUCTIONS (351 INSTRUCTIONS)

Table 1 Explanation of Items in Tables of Instructions

Item	Meaning
Mnemonic	Upper-case letters and symbols: Represented as they appear in assembler. Lower-case letters: Replaced when described in assembler. Numbers after lower-case letters: Indicate the bit width within the instruction code.
#	Indicates the number of bytes.
~	Indicates the number of cycles. m: When branching n: When not branching See Table 4 for details about meanings of other letters in items.
RG	Indicates the number of accesses to the register during execution of the instruction. It is used calculate a correction value for intermittent operation of CPU.
B	Indicates the correction value for calculating the number of actual cycles during execution of the instruction. (Table 5) The number of actual cycles during execution of the instruction is the correction value summed with the value in the “~” column.
Operation	Indicates the operation of instruction.
LH	Indicates special operations involving the upper 8 bits of the lower 16 bits of the accumulator. Z: Transfers “0”. X: Extends with a sign before transferring. –: Transfers nothing.
AH	Indicates special operations involving the upper 16 bits in the accumulator. *: Transfers from AL to AH. –: No transfer. Z: Transfers 00 <sub>H</sub> to AH. X: Transfers 00 <sub>H</sub> or FF <sub>H</sub> to AH by signing and extending AL.
I	Indicates the status of each of the following flags: I (interrupt enable), S (stack), T (sticky bit), N (negative), Z (zero), V (overflow), and C (carry). *: Changes due to execution of instruction. –: No change. S: Set by execution of instruction. R: Reset by execution of instruction.
S	
T	
N	
Z	
V	
C	
RMW	Indicates whether the instruction is a read-modify-write instruction. (a single instruction that reads data from memory, etc., processes the data, and then writes the result to memory.) *: Instruction is a read-modify-write instruction. –: Instruction is not a read-modify-write instruction. Note: A read-modify-write instruction cannot be used on addresses that have different meanings depending on whether they are read or written.

### • Number of execution cycles

The number of cycles required for instruction execution is acquired by adding the number of cycles for each instruction, a corrective value depending on the condition, and the number of cycles required for program fetch. Whenever the instruction being executed exceeds the two-byte (word) boundary, a program on an internal ROM connected to a 16-bit bus is fetched. If data access is interfered with, therefore, the number of execution cycles is increased.

For each byte of the instruction being executed, a program on a memory connected to an 8-bit external data bus is fetched. If data access is interfered with, therefore, the number of execution cycles is increased.

When a general-purpose register, an internal ROM, an internal RAM, an internal I/O device, or an external bus is accessed during intermittent CPU operation, the CPU clock is suspended by the number of cycles specified by the CG1/0 bit of the low-power consumption mode control register. When determining the number of cycles required for instruction execution during intermittent CPU operation, therefore, add the value of the number of times access is done × the number of cycles suspended as the corrective value to the number of ordinary execution cycles.

# MB90580B Series

**Table 2 Explanation of Symbols in Tables of Instructions**

Symbol	Meaning
A	32-bit accumulator The bit length varies according to the instruction. Byte : Lower 8 bits of AL Word : 16 bits of AL Long : 32 bits of AL and AH
AH AL	Upper 16 bits of A Lower 16 bits of A
SP	Stack pointer (USP or SSP)
PC	Program counter
PCB	Program bank register
DTB	Data bank register
ADB	Additional data bank register
SSB	System stack bank register
USB	User stack bank register
SPB	Current stack bank register (SSB or USB)
DPR	Direct page register
brg1	DTB, ADB, SSB, USB, DPR, PCB, SPB
brg2	DTB, ADB, SSB, USB, DPR, SPB
Ri	R0, R1, R2, R3, R4, R5, R6, R7
RWi	RW0, RW1, RW2, RW3, RW4, RW5, RW6, RW7
RWj	RW0, RW1, RW2, RW3
RLi	RL0, RL1, RL2, RL3
dir	Compact direct addressing
addr16 addr24 ad24 0 to 15 ad24 16 to 23	Direct addressing Physical direct addressing Bit 0 to bit 15 of addr24 Bit 16 to bit 23 of addr24
io	I/O area (000000 <sub>H</sub> to 0000FF <sub>H</sub> )
imm4 imm8 imm16 imm32 ext (imm8)	4-bit immediate data 8-bit immediate data 16-bit immediate data 32-bit immediate data 16-bit data signed and extended from 8-bit immediate data
disp8 disp16	8-bit displacement 16-bit displacement
bp	Bit offset
vct4 vct8	Vector number (0 to 15) Vector number (0 to 255)
( )b	Bit address
rel	PC relative addressing
ear eam	Effective addressing (codes 00 to 07) Effective addressing (codes 08 to 1F)
rlst	Register list

**Table 3 Effective Address Fields**

Code	Notation			Address format	Number of bytes in address extension *
00 01 02 03 04 05 06 07	R0 R1 R2 R3 R4 R5 R6 R7	RW0 RW1 RW2 RW3 RW4 RW5 RW6 RW7	RL0 (RL0) RL1 (RL1) RL2 (RL2) RL3 (RL3)	Register direct  “ea” corresponds to byte, word, and long-word types, starting from the left	—
08 09 0A 0B	@RW0 @RW1 @RW2 @RW3			Register indirect	0
0C 0D 0E 0F	@RW0 + @RW1 + @RW2 + @RW3 +			Register indirect with post-increment	0
10 11 12 13 14 15 16 17	@RW0 + disp8 @RW1 + disp8 @RW2 + disp8 @RW3 + disp8 @RW4 + disp8 @RW5 + disp8 @RW6 + disp8 @RW7 + disp8			Register indirect with 8-bit displacement	1
18 19 1A 1B	@RW0 + disp16 @RW1 + disp16 @RW2 + disp16 @RW3 + disp16			Register indirect with 16-bit displacement	2
1C 1D 1E 1F	@RW0 + RW7 @RW1 + RW7 @PC + disp16 addr16			Register indirect with index Register indirect with index PC indirect with 16-bit displacement Direct address	0 0 2 2

Note : The number of bytes in the address extension is indicated by the “+” symbol in the “#” (number of bytes) column in the tables of instructions.

# MB90580B Series

**Table 4 Number of Execution Cycles for Each Type of Addressing**

Code	Operand	(a)	Number of register accesses for each type of addressing
		Number of execution cycles for each type of addressing	
00 to 07	Ri RWi RLi	Listed in tables of instructions	Listed in tables of instructions
08 to 0B	@RWj	2	1
0C to 0F	@RWj +	4	2
10 to 17	@RWi + disp8	2	1
18 to 1B	@RWj + disp16	2	1
1C	@RW0 + RW7	4	2
1D	@RW1 + RW7	4	2
1E	@PC + disp16	2	0
1F	addr16	1	0

Note : “(a)” is used in the “~” (number of states) column and column B (correction value) in the tables of instructions.

**Table 5 Compensation Values for Number of Cycles Used to Calculate Number of Actual Cycles**

Operand	(b) byte		(c) word		(d) long	
	Cycles	Access	Cycles	Access	Cycles	Access
Internal register	+0	1	+0	1	+0	2
Internal memory even address	+0	1	+0	1	+0	2
Internal memory odd address	+0	1	+2	2	+4	4
Even address on external data bus (16 bits)	+1	1	+1	1	+2	2
Odd address on external data bus (16 bits)	+1	1	+4	2	+8	4
External data bus (8 bits)	+1	1	+4	2	+8	4

Notes: • “(b)”, “(c)”, and “(d)” are used in the “~” (number of states) column and column B (correction value) in the tables of instructions.

- When the external data bus is used, it is necessary to add in the number of wait cycles used for ready input and automatic ready.

**Table 6 Correction Values for Number of Cycles Used to Calculate Number of Program Fetch Cycles**

Instruction	Byte boundary	Word boundary
Internal memory	—	+2
External data bus (16 bits)	—	+3
External data bus (8 bits)	+3	—

Notes: • When the external data bus is used, it is necessary to add in the number of wait cycles used for ready input and automatic ready.

- Because instruction execution is not slowed down by all program fetches in actuality, these correction values should be used for “worst case” calculations.

\*1: Set to 3 when the division-by-0, 8 or 18 for an overflow, and 18 for normal operation.

\*2: Set to 3 when the division-by-0, 10 or 21 for an overflow, and 22 for normal operation.

\*3: Set to 4 + (a) when the division-by-0, 11 + (a) or 22 + (a) for an overflow, and 23 + (a) for normal operation.

\*4: Positive dividend: Set to 4 when the division-by-0, 10 or 29 for an overflow, and 30 for normal operation.

Negative dividend: Set to 4 when the division-by-0, 11 or 30 for an overflow and 31 for normal operation.

\*5: Positive dividend: Set to 4 + (a) when the division-by-0, 11 + (a) or 30 + (a) for an overflow, and 31 + (a) for normal operation.

Negative dividend: Set to 4 + (a) when the division-by-0, 12 + (a) or 31 + (a) for an overflow, and 32 + (a) for normal operation.

\*6: When the division-by-0, (b) for an overflow, and  $2 \times (b)$  for normal operation.

\*7: When the division-by-0, (c) for an overflow, and  $2 \times (c)$  for normal operation.

\*8: Set to 3 when byte (AH) is zero, 12 when the result is positive, and 13 when the result is negative.

\*9: Set to 3 when byte (ear) is zero, 12 when the result is positive, and 13 when the result is negative.

\*10: Set to 4 + (a) when byte (eam) is zero, 13 + (a) when the result is positive, and 14 + (a) when the result is negative.

\*11: Set to 3 when word (AH) is zero, 12 when the result is positive, and 13 when the result is negative.

\*12: Set to 3 when word (ear) is zero, 16 when the result is positive, and 19 when the result is negative.

\*13: Set to 4 + (a) when word (eam) is zero, 17 + (a) when the result is positive, and 20 + (a) when the result is negative.

Notes: • When overflow occurs during DIV or DIVW instruction execution, the number of execution cycles takes two values because of detection before and after an operation.

• When overflow occurs during DIV or DIVW instruction execution, the contents of AL are destroyed.

• For (a) to (d), refer to "Table 4 Number of Execution Cycles for Effective Address in Addressing Modes" and "Table 5 Correction Values for Number of Cycles for Calculating Actual Number of Cycles."

MOVSWD	2	*2	*8	*6	Word transfer @AH- ← @AL-, counter = RW0	—	—	—	—	—	—	—	—	—	—
SCWEQ/SCWEQI	2	*1	*8	*7	Word retrieval (@AH+) – AL, counter = RW0	—	—	—	—	—	*	*	*	*	—
SCWEQD	2	*1	*8	*7	Word retrieval (@AH-) – AL, counter = RW0	—	—	—	—	—	*	*	*	*	—
FILSW/FILSWI	2	6m +6	*8	*6	Word filling @AH+ ← AL, counter = RW0	—	—	—	—	—	*	*	—	—	—

m: RW0 value (counter value)

n: Loop count

\*1: 5 when RW0 is 0,  $4 + 7 \times (RW0)$  for count out, and  $7 \times n + 5$  when match occurs

\*2: 5 when RW0 is 0,  $4 + 8 \times (RW0)$  in any other case

\*3:  $(b) \times (RW0) + (b) \times (RW0)$  when accessing different areas for the source and destination, calculate (b) separately for each.

\*4:  $(b) \times n$

\*5:  $2 \times (RW0)$

\*6:  $(c) \times (RW0) + (c) \times (RW0)$  when accessing different areas for the source and destination, calculate (c) separately for each.

\*7:  $(c) \times n$

\*8:  $2 \times (RW0)$

Note : For an explanation of “(a)” to “(d)”, refer to Table 4, “Number of Execution Cycles for Each Type of Addressing,” and Table 5, “Correction Values for Number of Cycles Used to Calculate Number of Actual Cycles.”

## ■ ORDERING INFORMATION

Part number	Package	Remarks
MB90F583BPFV MB90583BPFV MB90587PFV	100-pin Plastic LQFP (FPT-100P-M05)	
MB90F583BPF MB90583BPF MB90587PF	100-pin Plastic QFP (FPT-100P-M06)	

# MB90580B Series

## PACKAGE DIMENSIONS

All Rights Reserved.

The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information and circuit diagrams in this document are presented as examples of semiconductor device applications, and are not intended to be incorporated in devices for actual use. Also, FUJITSU is unable to assume responsibility for infringement of any patent rights or other rights of third parties arising from the use of this information or circuit diagrams.

The contents of this document may not be reproduced or copied without the permission of FUJITSU LIMITED.

FUJITSU semiconductor devices are intended for use in standard applications (computers, office automation and other office equipments, industrial, communications, and measurement equipments, personal or household devices, etc.).

#### CAUTION:

Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with FUJITSU sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Control Law of Japan, the prior authorization by Japanese government should be required for export of those products from Japan.
