

1M x 4 Bit Static Random Access Memory

The MCM6249 is a 4,194,304 bit static random access memory organized as 1,048,576 words of 4 bits, fabricated using high-performance silicon-gate CMOS technology. Static design eliminates the need for external clocks or timing strobes, while CMOS circuitry reduces power consumption and provides for greater reliability.

The MCM6249 is equipped with chip enable ($\bar{E}$) and output enable ($\bar{G}$) pins, allowing for greater system flexibility and eliminating bus contention problems. Either input, when high, will force the outputs into high impedance.

The MCM6249 is available in a 400 mil, 32-lead surface-mount SOJ package.

- Single 5 V $\pm$ 10% Power Supply
- Fast Access Time: 20/25/35 ns
- Equal Address and Chip Enable Access Time
- All Inputs and Outputs are TTL Compatible
- Three-State Outputs
- Power Operation: 190/175/160 mA Maximum, Active AC

Operating Temperature	T_A	0 to + 70	°C
Storage Temperature — Plastic	T_{stg}	- 55 to + 150	°C

NOTE: Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. Functional operation should be restricted to RECOMMENDED OPERATING CONDITIONS. Exposure to higher than recommended voltages for extended periods of time could affect device reliability.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to these high impedance circuits.

This CMOS memory circuit has been designed to meet the dc and ac specifications shown in the tables, after thermal equilibrium has been established. The circuit is in a test socket or mounted on a printed circuit board and transverse air flow of at least 500 linear feet per minute is maintained.

NOTES:

1. W is high for read cycle.
2. Product sensitivities to noise require proper grounding and decoupling of power supplies as well as minimization or elimination of bus contention conditions during read and write cycles.
3. All read cycle timings are referenced from the last valid address to the first transitioning address.
4. Addresses valid prior to or coincident with E going low/E going high.
5. At any given voltage and temperature, $t_{EHQZ} \text{ max} < t_{ELQX} \text{ min}$, and $t_{GHQZ} \text{ max} < t_{GLQX} \text{ min}$, both for a given device and from device to device.
6. Transition is measured $\pm 500 \text{ mV}$ from steady-state voltage with load of Figure 1b.
7. This parameter is sampled and not 100% tested.
8. Device is continuously selected ($E \leq V_{IL}$, $G \leq V_{IL}$).

TIMING LIMITS

The table of timing values shows either a minimum or a maximum limit for each parameter. Input requirements are specified from the external system point of view. Thus, address setup time is shown as a minimum since the system must supply at least that much time. On the other hand, responses from the memory are specified from the device point of view. Thus, the access time is shown as a maximum since the device never provides data later than that time.

READ CYCLE 2 (See Note)

NOTE: Addresses valid prior to or coincident with $\bar{E}$ going low/ $\bar{E}$ going high.

WRITE CYCLE 1 ($\overline{W}$ Controlled, See Notes 1, 2, and 3)

Parameter	Symbol	MCM6249–20		MCM6249–25		MCM6249–35		Unit	Notes
		Min	Max	Min	Max	Min	Max

NOTES:

1. A write occurs during the overlap of $\overline{E}$ low and $\overline{W}$ low.
2. Product sensitivities to noise require proper grounding and decoupling of power supplies as well as minimization or elimination of bus contention conditions during read and write cycles.
3. If $\overline{G}$ goes low coincident with or after $\overline{W}$ goes low, the output will remain in a high–impedance state.
4. All write cycle timings are referenced from the last valid address to the first transitioning address.
5. Transition is measured ± 500 mV from steady–state voltage with load of Figure 1b.
6. This parameter is sampled and not 100% tested.
7. At any given voltage and temperature, $t_{WLQZ} \text{ max} < t_{WHQX} \text{ min}$ both for a given device and from device to device.
