

MCM67H618B

Advance Information
64K x 18 Bit BurstRAM
Synchronous Fast Static RAM
With Burst Counter and Self-Timed Write

FN PACKAGE
PLASTIC
CASE 778-02

The MCM67H618B is a 1,179,648 bit synchronous fast static random access memory designed to provide a burstable, high-performance, secondary cache for the i486™ and Pentium™ microprocessors. It is organized as 65,536 words of 18 bits, fabricated with Motorola's high-performance silicon-gate BiCMOS technology. The device integrates input registers, a 2-bit counter, high speed SRAM, and high drive capability outputs onto a single monolithic circuit for reduced parts count implementation of cache data RAM applications. Synchronous design allows precise cycle control with the use of an external clock (K). BiCMOS circuitry reduces the overall power consumption of the integrated functions for greater reliability.

Addresses (A0 – A15), data inputs (D0 – D17), and all control signals except output enable (G) are clock (K) controlled through positive-edge-triggered noninverting registers.

Bursts can be initiated with either address status processor (ADSP) or address status cache controller (ADSC) input pins. Subsequent burst addresses can be generated internally by the MCM67H618B (burst sequence imitates that of the i486 and Pentium) and controlled by the burst address advance (ADV) input pin. The following pages provide more detailed information on burst controls.

Write cycles are internally self-timed and are initiated by the rising edge of the clock (K) input. This feature eliminates complex off-chip write pulse generation and provides increased flexibility for incoming signals.

Dual write enables (LW and UW) are provided to allow individually writable bytes. LW controls DQ0 – DQ8 (the lower bits), while UW controls DQ9 – DQ17 (the upper bits).

This device is ideally suited for systems that require wide data bus widths and cache memory. See Figure 2 for applications information.

- Single 5 V ± 5% Power Supply
- Fast Access Times: 9/10/12 ns Max
- Byte Writeable via Dual Write Enables
- Internal Input Registers (Address, Data, Control)
- Internally Self-Timed Write Cycle
- ADSP, ADSC, and ADV Burst Control Pins
- Asynchronous Output Enable Controlled Three-State Outputs
- Common Data Inputs and Data Outputs
- 3.3 V I/O Compatible
- High Board Density 52-Lead PLCC Package
- ADSP Disabled with Chip Enable (E) — Supports Address Pipelining

PIN ASSIGNMENT

PIN NAMES

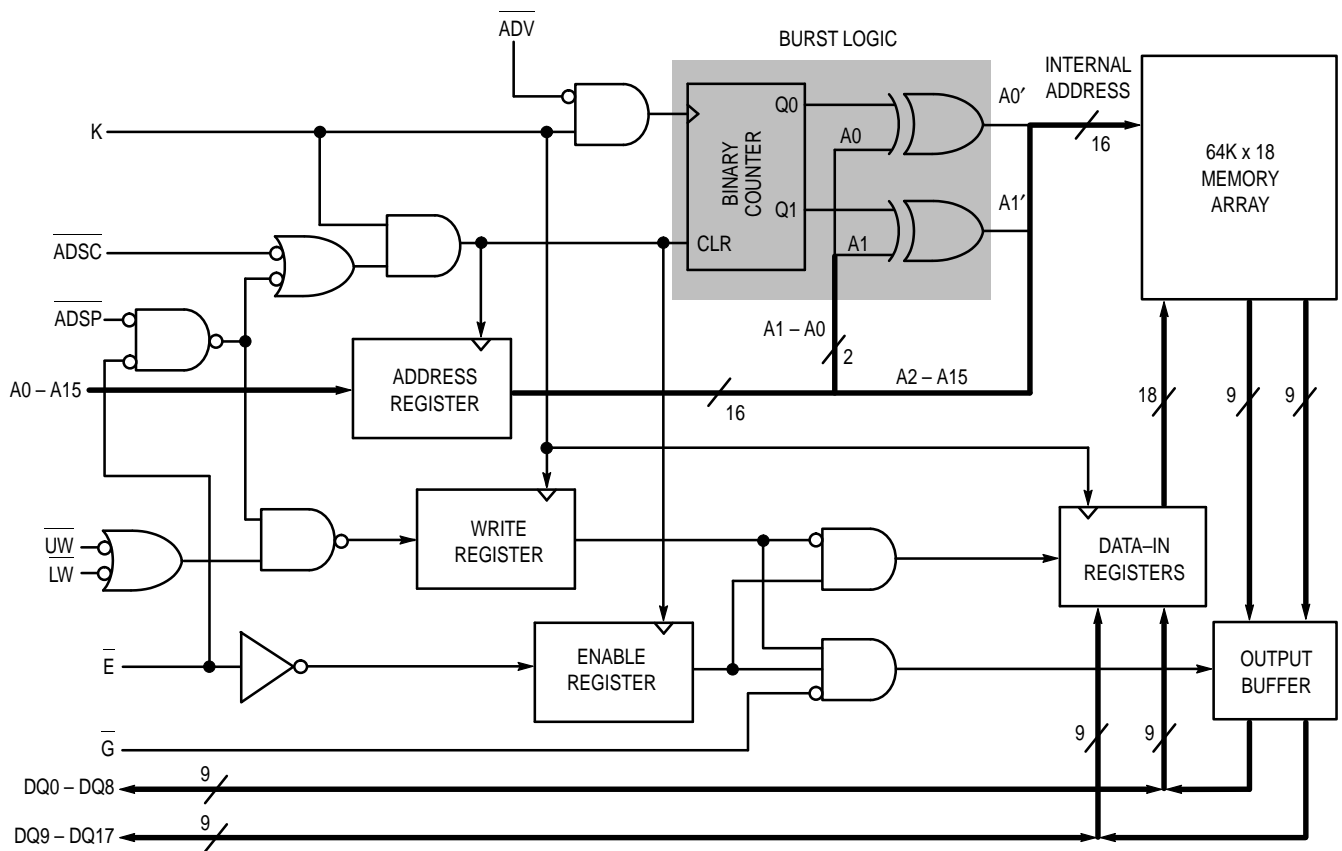

| | |
|------------|---------------------------|
| A0 – A15 | Address Inputs |
| K | Clock |
| ADV | Burst Address Advance |
| LW | Lower Byte Write Enable |
| UW | Upper Byte Write Enable |
| ADSC | Controller Address Status |
| ADSP | Processor Address Status |
| E | Chip Enable |
| G | Output Enable |
| DQ0 – DQ17 | Data Input/Output |
| VCC | + 5 V Power Supply |
| VSS | Ground |

All power supply and ground pins must be connected for proper operation of the device.

BLOCK DIAGRAM (See Note)

NOTE: All registers are positive-edge triggered. The $\overline{\text{ADSC}}$ or $\overline{\text{ADSP}}$ signals control the duration of the burst and the start of the next burst. When $\overline{\text{ADSP}}$ and $\overline{\text{E}}$ are sampled low, any ongoing burst is interrupted and a read (independent of $\overline{\text{W}}$ and $\overline{\text{ADSC}}$) is performed using the new external address. Alternatively, an $\overline{\text{ADSP}}$ -initiated two cycle **WRITE** can be performed by asserting $\overline{\text{ADSP}}$, $\overline{\text{E}}$, and a valid address on the first cycle, then negating both $\overline{\text{ADSP}}$ and $\overline{\text{ADSC}}$ and asserting $\overline{\text{LW}}$ and/or $\overline{\text{UW}}$ with valid data on the second cycle (see Single Write Cycle in **WRITE CYCLES** timing diagram). Note that when $\overline{\text{E}}$ and $\overline{\text{ADSC}}$ are high, $\overline{\text{ADSP}}$ is ignored — the external address is not registered in this case.

When $\overline{\text{ADSC}}$ is sampled low (and $\overline{\text{ADSP}}$ is sampled high), any ongoing burst is interrupted and a read or write (dependent on $\overline{\text{W}}$) is performed using the new external address. Chip enable ($\overline{\text{E}}$) is sampled only when a new base address is loaded. After the first cycle of the burst, $\overline{\text{ADV}}$ controls subsequent burst cycles. When $\overline{\text{ADV}}$ is sampled low, the internal address is advanced prior to the operation. When $\overline{\text{ADV}}$ is sampled high, the internal address is not advanced, thus inserting a wait state into the burst sequence accesses. Upon completion of a burst, the address will wrap around to its initial state. See **BURST SEQUENCE TABLE**. Write refers to either or both byte write enables ($\overline{\text{LW}}$, $\overline{\text{UW}}$).

BURST SEQUENCE TABLE (See Note)

| | | | |
|-------------------|----------|----|----|
| External Address | A15 – A2 | A1 | A0 |
| 1st Burst Address | A15 – A2 | A1 | A0 |
| 2nd Burst Address | A15 – A2 | A1 | A0 |
| 3rd Burst Address | A15 – A2 | A1 | A0 |

NOTE: The burst wraps around to its initial state upon completion.

SYNCHRONOUS TRUTH TABLE (See Notes 1, 2, and 3)

| E | ADSP | ADSC | ADV | UW or LW | K | Address Used | Operation |
|---|------|------|-----|----------|-----|------------------|-----------------------------|
| H | X | L | X | X | L-H | N/A | Deselected |
| L | L | X | X | X | L-H | External Address | Read Cycle, Begin Burst |
| L | H | L | X | L | L-H | External Address | Write Cycle, Begin Burst |
| L | H | L | X | H | L-H | External Address | Read Cycle, Begin Burst |
| X | H | H | L | L | L-H | Next Address | Write Cycle, Continue Burst |
| X | H | H | L | H | L-H | Next Address | Read Cycle, Continue Burst |
| X | H | H | H | L | L-H | Current Address | Write Cycle, Suspend Burst |
| X | H | H | H | H | L-H | Current Address | Read Cycle, Suspend Burst |
| H | X | H | L | L | L-H | Next Address | Write Cycle, Continue Burst |
| H | X | H | L | H | L-H | Next Address | Read Cycle, Continue Burst |
| H | X | H | H | L | L-H | Current Address | Write Cycle, Suspend Burst |
| H | X | H | H | H | L-H | Current Address | Read Cycle, Suspend Burst |

NOTES:

1. X means Don't Care.
2. All inputs except G must meet setup and hold times for the low-to-high transition of clock (K).
3. Wait states are inserted by suspending burst.

ASYNCHRONOUS TRUTH TABLE (See Notes 1 and 2)

| Operation | G | I/O Status |
|------------|---|------------------|
| Read | L | Data Out |
| Read | H | High-Z |
| Write | X | High-Z — Data In |
| Deselected | X | High-Z |

NOTES:

1. X means Don't Care.
2. For a write operation following a read operation, G must be high before the input data required setup time and held high through the input data hold time.

ABSOLUTE MAXIMUM RATINGS (Voltages Referenced to $V_{SS} = 0$ V)

| Rating | Symbol | Value | Unit |
|--|-------------------|-------------------------|-------------|
| Power Supply Voltage | V_{CC} | - 0.5 to + 7.0 | V |
| Voltage Relative to V_{SS} for Any Pin Except V_{CC} | V_{in}, V_{out} | - 0.5 to $V_{CC} + 0.5$ | V |
| Output Current (per I/O) | I_{out} | ± 30 | mA |
| Power Dissipation | P_D | 1.6 | W |
| Temperature Under Bias | T_{bias} | - 10 to + 85 | $^{\circ}C$ |
| Ambient Temperature | T_A | 0 to +70 | $^{\circ}C$ |
| Storage Temperature | T_{stg} | - 55 to + 125 | $^{\circ}C$ |

NOTE: Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. Functional operation should be restricted to RECOMMENDED OPERATING CONDITIONS. Exposure to higher than recommended voltages for extended periods of time could affect device reliability.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high-impedance circuit.

This BiCMOS memory circuit has been designed to meet the dc and ac specifications shown in the tables, after thermal equilibrium has been established.

This device contains circuitry that will ensure the output devices are in High-Z at power up.

DC OPERATING CONDITIONS AND CHARACTERISTICS

($V_{CC} = 5.0 \text{ V} \pm 5\%$, $T_A = 0 \text{ to } +70^\circ\text{C}$, Unless Otherwise Noted)

RECOMMENDED OPERATING CONDITIONS (Voltages Referenced to $V_{SS} = 0 \text{ V}$)

| Parameter | Symbol | Min | Max | Unit |
|--|----------|-------|---------------------|------|
| Supply Voltage (Operating Voltage Range) | V_{CC} | 4.75 | 5.25 | V |
| Input High Voltage | V_{IH} | 2.2 | $V_{CC} + 0.3^{**}$ | V |
| Input Low Voltage | V_{IL} | -0.5* | 0.8 | V |

* $V_{IL} \text{ (min)} = -0.5 \text{ V dc}$; $V_{IL} \text{ (min)} = -2.0 \text{ V ac}$ (pulse width $\leq 20.0 \text{ ns}$) for $I \leq 20.0 \text{ mA}$.

** $V_{IH} \text{ (max)} = V_{CC} + 0.3 \text{ V dc}$; $V_{IH} \text{ (max)} = V_{CC} + 2.0 \text{ V ac}$ (pulse width $\leq 20.0 \text{ ns}$) for $I \leq 20.0 \text{ mA}$.

DC CHARACTERISTICS AND SUPPLY CURRENTS

| Parameter | Symbol | Min | Max | Unit |
|--|--|-----|-----------|---------------|
| Input Leakage Current (All Inputs, $V_{in} = 0 \text{ to } V_{CC}$) | $I_{kg(I)}$ | — | ± 1.0 | μA |
| Output Leakage Current ($G = V_{IH}$) | $I_{kg(O)}$ | — | ± 1.0 | μA |
| AC Supply Current (Device Selected, All Outputs Open, Freq = Max) | I_{CCA} | — | TBD | mA |
| | MCM67H618B-9 MCM67H618B-10 MCM67H618B-12 | | | |
| CMOS Standby Supply Current (Device Deselected, Freq = 0, $V_{CC} = \text{Max}$, All Inputs Static at CMOS Levels $V_{in} \leq V_{SS} + 0.2 \text{ V}$ or $\geq V_{CC} - 0.2 \text{ V}$) | I_{SB2} | — | TBD | mA |
| Clock Running (Device Deselected, Freq = Max, $V_{CC} = \text{Max}$, All Inputs Toggling at CMOS Levels $V_{in} \leq V_{SS} + 0.2 \text{ V}$ or $\geq V_{CC} - 0.2 \text{ V}$) | I_{SB4} | — | TBD | mA |
| Output Low Voltage ($I_{OL} = +8.0 \text{ mA}$) | V_{OL} | — | 0.4 | V |
| Output High Voltage ($I_{OH} = -4.0 \text{ mA}$) | V_{OH} | 2.4 | 3.3 | V |

NOTE: Good decoupling of the local power supply should always be used. DC characteristics are guaranteed for all possible i486 and Pentium bus cycles.

CAPACITANCE ($f = 1.0 \text{ MHz}$, $dV = 3.0 \text{ V}$, $T_A = 25^\circ\text{C}$, Periodically Sampled Rather Than 100% Tested)

| Parameter | Symbol | Typ | Max | Unit |
|--------------------------|-----------|-----|-----|------|
| Input Capacitance | C_{in} | 4 | 5 | pF |
| Input/Output Capacitance | $C_{I/O}$ | 6 | 8 | pF |

AC OPERATING CONDITIONS AND CHARACTERISTICS

($V_{CC} = 5.0\text{ V} \pm 5\%$, $T_A = 0\text{ to } +70^\circ\text{C}$, Unless Otherwise Noted)

Input Timing Measurement Reference Level 1.5 V
 Input Pulse Levels 0 to 3.0 V
 Input Rise/Fall Time 3 ns

Output Timing Reference Level 1.5 V
 Output Load See Figure 1 Unless Otherwise Noted

READ/WRITE CYCLE TIMING (See Notes 1, 2, 3, and 4)

| Parameter | Symbol | MCM67H618B-9 | | MCM67H618B-10 | | MCM67H618B-12 | | Unit | Notes | |

| | Address Advance | t_{KHADVX} | | | | | | | | |
| | Chip Enable | $t_{KH EX}$ | | | | | | | | |

NOTES:

- In setup and hold times, W (write) refers to either one or both byte write enables LW and UW .
- A read cycle is defined by UW and LW high or $ADSP$ low for the setup and hold times. A write cycle is defined by LW or UW low and $ADSP$ high for the setup and hold times.
- All read and write cycle timings are referenced from K or \bar{G} .
- G is a don't care when UW or LW is sampled low.
- Maximum access times are guaranteed for all possible i486 and Pentium external bus cycles.
- Transition is measured $\pm 500\text{ mV}$ from steady-state voltage. This parameter is sampled rather than 100% tested. At any given voltage and temperature, t_{KHQZ} max is less than t_{KHQZ1} min for a given device and from device to device.
- This is a synchronous device. All addresses must meet the specified setup and hold times for **ALL** rising edges of K whenever $ADSP$ or $ADSC$ is low, and the chip is selected. All other synchronous inputs must meet the specified setup and hold times for **ALL** rising edges of K when the chip is enabled. Chip enable must be asserted at each rising edge of clock for the device (when $ADSC$ is low) to remain enabled.

PACKAGE DIMENSIONS

**FN PACKAGE
52-LEAD PLCC
CASE 778-02**

NOTES:

- DATUMS -L-, -M-, AND -N- DETERMINED WHERE TOP OF LEAD SHOULDER EXITS PLASTIC BODY AT MOLD PARTING LINE.
- DIMENSION G1, TRUE POSITION TO BE MEASURED AT DATUM -T-, SEATING PLANE.
- DIMENSIONS R AND U DO NOT INCLUDE MOLD FLASH. ALLOWABLE MOLD FLASH IS 0.010 (0.250) PER SIDE.
- DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982.
- CONTROLLING DIMENSION: INCH.
- THE PACKAGE TOP MAY BE SMALLER THAN THE PACKAGE BOTTOM BY UP TO 0.012 (0.300). DIMENSIONS R AND U ARE DETERMINED AT THE OUTERMOST EXTREMES OF THE PLASTIC BODY EXCLUSIVE OF MOLD FLASH, TIE BAR BURRS, GATE BURRS AND INTERLEAD FLASH, BUT INCLUDING ANY MISMATCH BETWEEN THE TOP AND BOTTOM OF THE PLASTIC BODY.
- DIMENSION H DOES NOT INCLUDE DAMBAR PROTRUSION OR INTRUSION. THE DAMBAR PROTRUSION(S) SHALL NOT CAUSE THE H DIMENSION TO BE GREATER THAN 0.037 (0.940). THE DAMBAR INTRUSION(S) SHALL NOT CAUSE THE H DIMENSION TO BE SMALLER THAN 0.025 (0.635).
