

# L4949, NCV4949

## 100 mA, 5.0 V, Low Dropout Voltage Regulator with Power-On Reset

The L4949 is a monolithic integrated 5.0 V voltage regulator with a very low dropout and additional functions such as power-on reset and input voltage sense.

It is designed for supplying the micro-computer controlled systems especially in automotive applications.

### Features

- Operating DC Supply Voltage Range 5.0 V to 28 V
- Transient Supply Voltage Up to 40 V
- Extremely Low Quiescent Current in Standby Mode
- High Precision Standby Output Voltage 5.0 V  $\pm$ 1%
- Output Current Capability Up to 100 mA
- Very Low Dropout Voltage Less Than 0.4 V
- Reset Circuit Sensing The Output Voltage
- Programmable Reset Pulse Delay With External Capacitor
- Voltage Sense Comparator
- Thermal Shutdown and Short Circuit Protections
- NCV Prefix for Automotive and Other Applications Requiring Site and Control Changes
- Pb-Free Packages are Available

## ABSOLUTE MAXIMUM RATINGS

Rating	Symbol	Value	Unit
DC Operating Supply Voltage	$V_{CC}$	28	V
Transient Supply Voltage ( $t < 1.0$ s)	$V_{CC\ TR}$	40	V
Output Current	$I_{out}$	Internally Limited	–
Output Voltage	$V_{out}$	20	V
Sense Input Current	$I_{SI}$	$\pm 1.0$	mA
Sense Input Voltage	$V_{SI}$	$V_{CC}$	–
Output Voltages Reset Output Sense Output	$V_{Reset}$ $V_{SO}$	20 20	V
Output Currents Reset Output Sense Output	$I_{Reset}$ $I_{SO}$	5.0 5.0	mA
Preregulator Output Voltage	$V_Z$	7.0	V
Preregulator Output Current	$I_Z$	5.0	mA
ESD Protection at any pin Human Body Model Machine Model	– –	2000 400	V
Thermal Resistance, Junction-to-Air P Suffix, DIP-8 Plastic Package, Case 626 D Suffix, SOIC-8 Plastic Package, Case 751 D Suffix, SOIC-20 Plastic Package, Case 751D	$R_{\theta JA}$	100 200 80	$^{\circ}C/W$
Operating Junction Temperature Range	$T_J$	–40 to +150	$^{\circ}C$
Storage Temperature Range	$T_{stg}$	–65 to +150	$^{\circ}C$

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

## ELECTRICAL CHARACTERISTICS ( $V_{CC} = 14$ V, $-40^{\circ}C < T_A < 125^{\circ}C$ , unless otherwise specified.)

Characteristic	Symbol	Min	Typ	Max	Unit
Output Voltage ( $T_A = 25^{\circ}C$ , $I_{out} = 1.0$ mA)	$V_{out}$	4.95	5.0	5.05	V
Output Voltage ( $6.0$ V $< V_{CC} < 28$ V, $1.0$ mA $< I_{out} < 50$ mA)	$V_{out}$	4.9	5.0	5.1	V
Output Voltage ( $V_{CC} = 35$ V, $t < 1.0$ s, $1.0$ mA $< I_{out} < 50$ mA)	$V_{out}$	4.9	5.0	5.1	V
Dropout Voltage $I_{out} = 10$ mA $I_{out} = 50$ mA $I_{out} = 100$ mA	$V_{drop}$	– – –	0.1 0.2 0.3	0.25 0.40 0.50	V
Input to Output Voltage Difference in Undervoltage Condition ( $V_{CC} = 4.0$ V, $I_{out} = 35$ mA)	$V_{IO}$	–	0.2	0.4	V
Line Regulation ( $6.0$ V $< V_{CC} < 28$ V, $I_{out} = 1.0$ mA)	$Reg_{line}$	–	1.0	20	mV
Load Regulation ( $1.0$ mA $< I_{out} < 100$ mA)	$Reg_{load}$	–	8.0	30	mV
Current Limit $V_{out} = 4.5$ V $V_{out} = 0$ V	$I_{Lim}$	105 –	200 100	400 –	mA
Quiescent Current ( $I_{out} = 0.3$ mA, $T_A < 100^{\circ}C$ )	$I_{QSE}$	–	150	260	$\mu A$
Quiescent Current ( $I_{out} = 100$ mA)	$I_Q$	–	–	5.0	mA

APPLICATION INFORMATION

Supply Voltage Transient

High supply voltage transients can cause a reset output signal perturbation. For supply voltages greater than 8.0 V the circuit shows a high immunity of the reset output against supply transients of more than 100 V/ $\mu$ s. For supply voltages

less than 8.0 V supply transients of more than 0.4 V/ $\mu$ s can cause a reset signal perturbation. To improve the transient behavior for supply voltages less than 8.0 V a capacitor at Pin 3 can be used. A capacitor at Pin 3 ( $C_3 \leq 1.0 \mu$ F) reduces also the output noise.

- NOTE: 1. For stability:  $C_s \geq 1.0 \mu$ F,  $C_o \geq 4.7 \mu$ F,  $ESR < 10 \Omega$  at 10 kHz  
 2. Recommended for application:  $C_s = C_o = 10 \mu$ F

Figure 12. Application Schematic

OPERATING DESCRIPTION

The L4949 is a monolithic integrated low dropout voltage regulator. Several outstanding features and auxiliary functions are implemented to meet the requirements of supplying microprocessor systems in automotive applications. Nevertheless, it is suitable also in other applications where the present functions are required. The modular approach of this device allows the use of other features and functions independently when required.

**Voltage Regulator**

The voltage regulator uses an isolated Collector Vertical PNP transistor as a regulating element. With this structure, very low dropout voltage at currents up to 100 mA is obtained. The dropout operation of the standby regulator is maintained down to 3.0 V input supply voltage. The output voltage is regulated up to the transient input supply voltage of 35 V. With this feature no functional interruption due to overvoltage pulses is generated.

The typical curve showing the standby output voltage as a function of the input supply voltage is shown in Figure 14.

The current consumption of the device (quiescent current) is less than 200  $\mu$ A.

To reduce the quiescent current peak in the undervoltage region and to improve the transient response in this region, the dropout voltage is controlled. The quiescent current as a function of the supply input voltage is shown in Figure 15.

**Short Circuit Protection:**

The maximum output current is internally limited. In case of short circuit, the output current is foldback current limited as described in Figure 13.

Figure 13. Foldback Characteristic of  $V_{out}$

Figure 14. Output Voltage versus Supply Voltage

Figure 15. Quiescent Current versus Supply Voltage

**Preregulator**

To improve the transient immunity a preregulator stabilizes the internal supply voltage to 6.0 V. This internal voltage is present at Pin 3 ( $V_Z$ ). This voltage should not be used as an output because the output capability is very small ( $\leq 100 \mu$ A).

This output may be used as an option when better transient behavior for supply voltages less than 8.0 V is required. In this case a capacitor (100 nF – 1.0  $\mu$ F) must be connected between Pin 3 and GND. If this feature is not used Pin 3 must be left open.

# L4949, NCV4949

## Reset Circuit

The block circuit diagram of the reset circuit is shown in Figure 16.

The reset circuit supervises the output voltage. The reset threshold of 4.5 V is defined with the internal reference voltage and standby output divider.

The reset pulse delay time  $t_{RD}$ , is defined with the charge time of an external capacitor  $C_T$ :

$$t_{RD} = \frac{C_T \times 2.0 \text{ V}}{2.0 \mu\text{A}}$$

The reaction time of the reset circuit originates from the discharge time limitation of the reset capacitor  $C_T$  and is proportional to the value of  $C_T$ . The reaction time of the reset circuit increases the noise immunity.

Figure 16. Reset Circuit

Standby output voltage drops below the reset threshold only a bit longer than the reaction time results in a shorter reset delay time.

The nominal reset delay time will be generated for standby output voltage drops longer than approximately 50 μs. The typical reset output waveforms are shown in Figure 17.

Figure 17. Typical Reset Output Waveforms

## Sense Comparator

The sense comparator compares an input signal with an internal voltage reference of typical 1.23 V. The use of an external voltage divider makes this comparator very flexible in the application.

It can be used to supervise the input voltage either before or after the protection diode and to give additional information to the microprocessor like low voltage warnings.
