

64-common X 160-segment + 1-icon common Bitmap LCD Driver

■ GENERAL DESCRIPTION

The **NJU6655** is a bitmap LCD driver to display graphics or characters.

It contains 10,400 bits display data RAM, microprocessor interface circuits, instruction decoder, 64-common and 160-segment + 1-icon-common drivers.

The bit image display data is transferred to the display data RAM by serial or 8-bit parallel interface.

65 x 160 dots graphics or 10-character 4-line by 16 x 16 dots character with icon are displayed by **NJU6655** itself.

The wide operating voltage from 2.4 to 5.5V and low operating current are suitable for battery-powered applications.

The build-in Electrical Variable Resistance is very precision, furthermore the rectangle outlook is very applicable to COG or Slim TCP.

■ PACKAGE OUTLINE

NJU6655CJ

■ FEATURES

- Direct Correspondence between Display Data RAM and LCD Pixel
- Display Data RAM - 10,400 bits
- 225 LCD Drivers - 64-common and 160-segment + 1-icon common
- Direct Microprocessor Interface for both of 68 and 80 type MPU
- Serial Interface (SI, SCL, A0, CS_{1b}, CS₂)
- Programmable Bias selection : 1/5, 1/7, 1/9 bias
- Useful Instruction Set
 - Display On/Off Cont, Initial Display Line Set, Page Address Set, Column Address Set, Status Read,
 - Display Data Read/Write, ADC Select, Inverse Display, Entire Display On/Off, Bias Select, Read Modify Write,
 - End, Reset, Common Direction Register Set, Power control set, Feedback Resistor Ratio Set,
 - EVR Mode Set, EVR Register Set, Static Indicator On/Off, Static Indicator Register Set, Power Save,
 - Power Save Reset, n-line Inverse Drive Register Set, n-line Inverse Drive Reset, Partial Select,
 - Internal Oscillation Circuit ON.
- Power Supply Circuits for LCD Incorporated
 - Voltage Booster Circuits (4-time Maximum),
 - Voltage Adjust Circuits, Voltage Follower x 4
- Voltage Regulator Incorporated
- Precision Electrical Variable Resistance (64-step)
- Low Power Consumption T.B.D.uA(Typ.).
- Operating Voltage (All the voltages are based on V_{DD}=0V.)
 - Logic Operating Voltage : -2.4V to -5.5V
 - Voltage Booster Operating Voltage : -2.4V to -6.0V
 - LCD Driving Voltage : -4.5V to -18.0V
- Rectangle outlook for COG
- Package Outline : Bump-chip
- C-MOS Technology (Substrate : N)

■ PAD COORDINATES

■ FUNCTIONAL DESCRIPTION

(1) Description for each blocks

(1-1) Busy Flag (BF)

During internal operation, the LSI is being busy and can't accept any instructions except "status read". The BF data is output through D₇ terminal by the "status read" instruction.

When the cycle time (tcyc) mentioned in the "AC characteristics" is satisfied, the BF check isn't required after each instruction, so that MPU processing performance can be improved.

(1-2) Initial display line register

The initial display line register assigns a DDRAM line address, which corresponds to COM₀ by "initial display line set" instruction. It is used for not only normal display but also vertical display scrolling and page switching without changing the contents of the DDRAM.

However, the 65th address for icon display can't be assigned for initial display line address.

(1-3) Line counter

The line counter provides a DDRAM line address. It initializes its contents at the switching of frame timing signal (FR), and also counts-up in synchronization with common timing signal.

(1-4) Column address counter

The column address counter is an 8-bit preset counter, which provides a DDRAM column address, and it is independent of below-mentioned page address register.

It will increment (+1) the column address whenever "display data read" or "display data write" instructions are issued. However, the counter will be locked when no-existing address above A0_H are addressed. The count-lock will be able to be released by the "column address set" instruction again. The counter can invert the correspondence between the column address and segment driver direction by means of "ADC set" instruction.

(1-5) Page address register

The page address register provides a DDRAM page address.

The last page address "8" should be used for icon display because the only D₀ is valid.

(1-6) Display data RAM (DDRAM)

The DDRAM contains 10,400-bit, and stores display data, which are 1-to-1 correspondents to LCD panel pixels.

When normal display mode, the display data "1" turns on and "0" turns off LCD pixels. When inverse display mode, "1" turns off and "0" turns on.

Fig.1 Display data RAM (DDRAM) Map

* : COMM is independent of the "Initial display line set" instruction and always corresponds to the 65th line.

For example the Initial display is 08_H.

(1-7) Common direction register

The common direction register is selected by the "Partial Select" and "Common Direction Register Set" instructions as shown in Table 1. When using the partial display function, the COM₀ - COM₁₅ and COM₄₈ - COM₆₃ terminals cannot be used.

Table 1. Common direction

Partial Select	Common Direction Register Set	Common drivers				
D ₀	D ₃	PAD No.	114	83	309	278
0	0	Pin name	C ₀	C ₃₁	C ₆₃	C ₃₂
0	1		COM ₀ → COM ₃₁		COM ₆₃ ← COM ₃₂	
			COM ₆₃ ← COM ₃₂		COM ₀ → COM ₃₁	
		PAD No.	98	83	293	278
1	0	Pin name	C ₁₆	C ₃₁	C ₄₇	C ₃₂
1	1		COM ₁₆ → COM ₃₁		COM ₄₇ ← COM ₃₂	
			COM ₄₇ ← COM ₃₂		COM ₁₆ → COM ₃₁	

(1-8) Reset circuit

The reset circuit initializes the LSI to the following status by using of the reset signal into the RESb terminal.

-Reset status using the RESb terminal:

1. Display off
2. Normal display (Non-inverse display)
3. ADC select : Normal mode (D₀="0")
4. Power control register clear : D₂,D₁,D₀="0,0,0"
5. Serial interface register clear
6. LCD bias select : D₁,D₀="0,0"(1/9 bias)
7. Power save reset
8. Entire display off : Normal mode
9. Internal oscillation circuit stop
10. Partial select : D₀="0"(1/65 duty)
11. Static indicator off
 Static indicator register : D₁,D₂="0,0"
12. Read modify write off
13. Initial display line address : 00_H
14. Column address : 00_H
15. Page address : 0 page
16. Common direction register : D₃="0"(Normal)
17. Feedback resistors ratio : D₂,D₁,D₀="0,0,0"
18. EVR mode off and EVR register: D₅,D₄,D₃,D₂,D₁,D₀="1,0,0,0,0,0"
19. n-line inverse drive register : D₃,D₂,D₁,D₀="0,0,0,0"(n-line inverse reset)
20. Test mode reset (Test mode 1 and Test mode 2)

The RES terminal should be connected to MPU's reset terminal, and the reset operation should be executed at the same timing of the MPU reset. As described in the "BUS TIMING CHARACTERISTICS", it is necessary to input 1.5us(min.) or over "L" level signal into the RES terminal in order to carry out the reset operation. The LSI will return to normal operation after about 1.5us(max.) from the rising edge of the reset signal.

The reset operation by RESb="L" initializes each register setting as above reset status, but the internal oscillation circuit and output terminals (D₀ to D₇) are not affected.

The reset operation is necessary to avoid malfunctions.

Note 1) The "Reset" instruction in Table.4 can't be substituted for the reset operation by using of the RES terminal. It executes above-mentioned only 11 to 20 items.

Note 2) The reset terminal is susceptible to external noise, so design PCB layout in consideration for the noise.

Note 3) In case of using external power supply for LCD driving voltage, the RESb terminal is required to be being "L" level when the external power supply is turned-on.

(1-9) LCD driving circuits

(a) Common and segment drivers

LCD drivers consist of 64-common drivers, 160-segment drivers and 1-icon-common driver.

As shown in “■ LCD driving waveform”, LCD driving waveforms are generated by the combination of display data, common timing signal and internal FR timing signal.

(b) Display data latch circuit

The display data latch circuit temporally stores 160-bit display data transferred from the DDRAM in the synchronization with the common timing signal, and then it transfers these stored data to the segment drivers.

“Display on/off”, “inverse display on/off” and “entire display on/off” instructions control only the contents of this latch circuit, they can’t change the contents of the DDRAM.

In addition, the LCD display isn’t affected by the DDRAM accesses during its displaying because the data read-out timing from this latch circuit to the segment drivers is independent of accessing timing to the DDRAM.

(c) Line counter and latch signal or latch Circuits

The clock line counter and latch signal to the latch circuits are generated from the internal display clock (CL). The line address of display data RAM is renewed synchronizing with display clock (CL).

160bits display data are latched in display latch circuits synchronizing with display clock, and then output to the LCD driving circuits. The display data transfer to the LCD driving circuits is executed independently with RAM access by the MPU.

(d) Display timing generator

The display timing generates the timing signal for the display system by combination of the master clock CL and driving signal FR (refer to Fig.2) The frame signal FR and LCD alternative signal generate LCD driving waveform on the 2-frame alternative driving method or the n-line inverse driving method.

(e) Common timing generation

The common timing is generated by display clock CL (refer to Fig.2)

Fig.2-1 2-frame alternating drive mode

Fig.2-2 n-line inverse drive mode (n=7, line inverting register sets to 6)

(f) Oscillator

This is the low power consumption CR oscillator which provides the display clock and voltage converter timing clock.

(g) Internal power circuits

The internal power circuits are composed of x4 boost voltage converter, output voltage regulator including 64-step EVR and voltage followers.

The optimum values of the external passive components for the internal power circuits, such as capacitors for V_1 to V_5 terminals and feed back resistors for VR terminal, depend on LCD panel size. Therefore, it is necessary to evaluate the actual LCD module with these external components in order to determine the optimum values.

Each portion of the internal power circuits is controlled by “power control set” instruction as shown in Table.2. In addition, the combination of power supply circuits is described in Table.3.

Table.2 Power control set

Portions		Status	
		“1”	“0”
D ₂	Voltage converter	ON	OFF
D ₁	Voltage regulator	ON	OFF
D ₀	Voltage followers	ON	OFF

Table.3 Power supply combinations

Status	D ₂	D ₁	D ₀	Voltage converter	Voltage regulator	Voltage followers	External voltage	Capacitor terminals
1) Using all internal power circuits	1	1	1	ON	ON	ON	V _{SS2}	Use
2) Using voltage regulator and Voltage followers	0	1	1	OFF	ON	ON	V _{OUT} , V _{SS2}	Open
3) Using voltage followers	0	0	1	OFF	OFF	ON	V _{OUT} , V ₅ , V _{SS2}	Open
4) Using only external power supply	0	0	0	OFF	OFF	OFF	V _{OUT} , V ₁ ~V ₅	Open

* Capacitor input terminals: C1+, C1-, C2+, C2-, C3-

* Do not use other combinations except examples in Table.3.

The internal LCD power supply is designed to drive small LCD panels such as cellular phones. Thus, if the IC is used to drive a large panel, make sure whether it works with the internal power supply or needs an external power supply.

The selections of external components for the LCD bias circuit, the voltage booster and the feedback loop depend on panel sizes, so make sure what are the best values in the particular application.

○Power Supply applications

Power Control Instruction

D_2 : Boost Circuit

D_1 : Voltage Regulator

D_0 : Voltage Follower

(1) Internal power supply Example.

All of the Internal Booster, Voltage Regulator, Voltage Follower using
 $(D_2, D_1, D_0) = (1, 1, 1)$

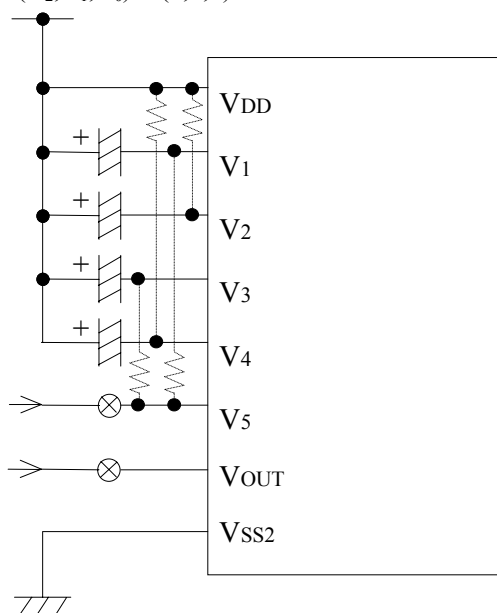

(2) Only V_{OUT} Supply from outside Example.

Internal Voltage Regulator, Voltage Follower using.
 $(D_2, D_1, D_0) = (0, 1, 1)$

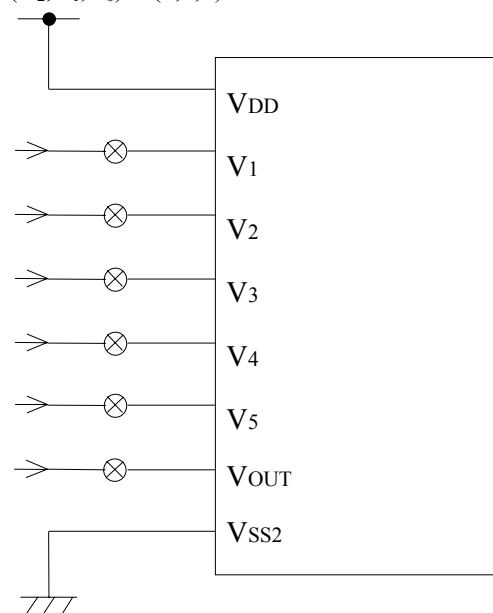

(3) V_{OUT} and V_5 Supply from outside Example.

Internal Voltage Follower using.
 $(D_2, D_1, D_0) = (0, 0, 1)$

(4) External Power Supply Example.

All of V_1 to V_5 and V_{OUT} supply from outside
 $(D_2, D_1, D_0) = (0, 0, 0)$

⊗ : These switches should be open during the power save mode.

Note) : When using the voltage follower circuit, external resistors may be necessary to stabilize V_1, V_2, V_3 and V_4 voltages.

(2) Instruction set

The **NJU6655** distinguishes the signal on the data bus D₀ to D₇ as an Instruction by combination of A0 , RD_b and WR_b(R/W). The decode of the instruction and execution performs with only high speed Internal timing without relation to the external clock. Therefore no busy flag check required normally. In case of serial interface, the data input as MSB(D₇) first serially. The Table. 4-1,4-2 shows the instruction codes of the **NJU6655**.

Table. 4-1 Instruction table

(2-1) Explanation of Instruction Code

(a) Display On/Off

This instruction selects display turn-on or turn-off regardless of the contents of the DDRAM.

A0	RDb	WRb	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	1	0	1	0	1	1	1	D

D 0: Display Off
 1: Display On

(b) Initial Display Line Set

This instruction specifies the DDRAM line address which corresponds to the COM₀ position. By means of repeating this instruction, the initial display line address will be dynamically changed; it means smooth display scrolling will be enabled.

A0	RDb	WRb	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	0	1	A ₅	A ₄	A ₃	A ₂	A ₁	A ₀

A ₅	A ₄	A ₃	A ₂	A ₁	A ₀	Line Address (HEX)
0	0	0	0	0	0	00
0	0	0	0	0	1	01
:	:	:	:	:	:	:
:	:	:	:	:	:	:
1	1	1	1	1	1	3F

(c) Page Address Set

In order to access to the DDRAM for writing or reading display data, both “page address set” and “column address set” instructions are required before accessing.

The last page address “8” should be used for icon display because the only D₀ is valid.

A0	RDb	WRb	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	1	0	1	1	A ₃	A ₂	A ₁	A ₀

A ₃	A ₂	A ₁	A ₀	Page
0	0	0	0	0
0	0	0	1	1
:	:	:	:	:
:	:	:	:	:
1	0	0	0	8

(d) Column Address Set

As above-mentioned, in order to access to the DDRAM for writing or reading display data, it is necessary to execute both “page address set” and “column address set” before accessing. The 8-bit column address data will be valid when both upper 4-bit and lower 4-bit data are set into the column address register.

Once the column address is set, it will automatically increment (+1) whenever the DDRAM will be accessed, so that the DDRAM will be able to be continuously accessed without “column address set” instruction.

The column address will stop increment and the page address will not be changed when the last address 9F_H is addressed.

A0	RDb	WRb	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀	
0	1	0	0	0	0	1	A ₇	A ₆	A ₅	A ₄	Upper 4-bit
0	1	0	0	0	0	0	A ₃	A ₂	A ₁	A ₀	Lower 4-bit

A ₇	A ₆	A ₅	A ₄	A ₃	A ₂	A ₁	A ₀	Column Address (HEX)	
0	0	0	0	0	0	0	0	00	
0	0	0	0	0	0	0	1	01	
⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮	
⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮	
1	0	0	1	1	1	1	1	9F	

(e) Status Read

This instruction reads out the internal status regarding “busy flag”, “ADC select”, “display on/off” and “reset”.

A0	RDb	WRb	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	0	1	BUSY	ADC	ON/OFF	RESET	0	0	0	0

BUSY : When D₇ is “1”, the LSI is being busy and can’t accept any instructions.

ADC : It shows the correspondence between the column address and segment drivers.
 When D₆ is “0”, the column address (159-n) corresponds to segment driver n.
 When D₆ is “1”, the column address (n) corresponds to segment driver n.
 Please be careful that read out data is opposite of “ADC select” instruction data.

ON/OFF : It shows display on or off status.
 When D₅ is “0”, the LSI is in display-on status.
 When D₅ is “1”, the LSI is in display-off status.
 Please be careful that read out data is opposite of “Display On/Off” instruction data.

RESET : It shows reset status.
 When D₄ is “0”, the LSI is in normal operation.
 When D₄ is “1”, the LSI is during reset operation.

(f) Display Data Write

This instruction writes display data into the selected column address on the DDRAM.

The column address automatically increments (+1) whenever the display data is written by this instruction, so that this instruction can be continuously issued without “column address set” instruction.

A0	RDb	WRb	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
1	1	0	Write Data							

(g) Display Data Read

This instruction reads out the display data stored in the selected column address on the DDRAM. The column address automatically increments (+1) whenever the display data is read out by this instruction, so that this instruction can be continuously issued without "column address set" instruction. After the "column address set" instruction, a dummy read will be required, please refer to the (4-4). In case of using serial interface mode, this instruction can't be used.

A0	RDb	WRb	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
1	0	1	Read Data							

(h) ADC Select

This instruction selects segment driver direction. The correspondence between the column address and segment driver direction is shown in Fig.1. This function reduces the restrictions on the IC position of an LCD module.

A0	RDb	WRb	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	1	0	1	0	0	0	0	D

- D 0: Clockwise Output (Normal) Segment Driver S₀ to S₁₅₉
 1: Counterclockwise Output (Inverse) Segment Driver S₁₅₉ to S₀

(i) Inverse Display On/Off

This instruction inverses the status of turn-on or turn-off of entire LCD pixels. It doesn't change the contents of the DDRAM.

A0	RDb	WRb	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	1	0	1	0	0	1	1	D

- D 0: Normal RAM data "1" correspond to "On"
 1: Inverse RAM data "0" correspond to "On"

(j) Whole Display On/Off

This instruction turns on entire LCD pixels regardless the contents of the DDRAM. It doesn't change the contents of DDRAM. This instruction should be performed prior to the "Inverse display On/Off" instruction.

A0	RDb	WRb	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	1	0	1	0	0	1	0	D

- D 0: Normal Display (Whole Display Off)
 1: Whole Display Turns On (Whole Display On)

(k) Bias Select

This instruction selects LCD bias value.

A0	RDb	WRb	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	1	0	0	1	0	0	A ₁	A ₀

A ₁	A ₀	LCD Bias
0	0	1/9
0	1	1/7
1	0	1/5
1	1	Prohibited*

* : Because it may malfunction-operate, do not set (D₁,D₀) = (1,1).

(l) Read Modify Write

This instruction controls column address increment.

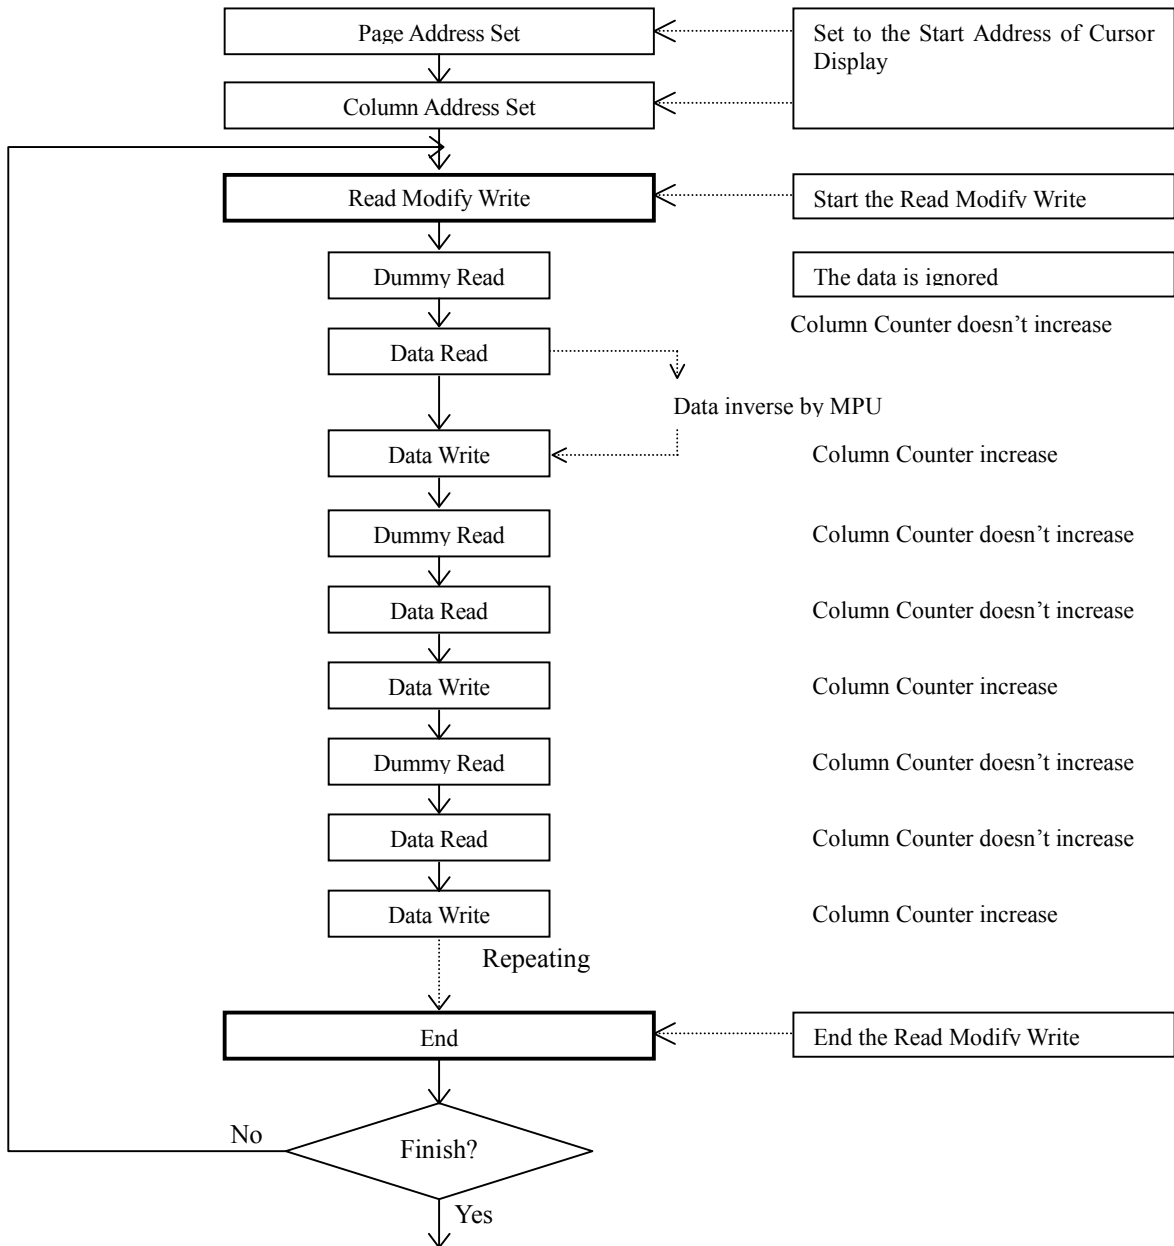

By using of this instruction, the column address can't increment when read operation but it can increment when write operation. This status will be continued until the below-mentioned "end" instruction will be issued.

This instruction can reduce the load of MPU, during the display data in specific DDRAM area is repeatedly changed for cursor blink or others.

A0	RDb	WRb	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	1	1	0	0	0	0	0

Note) In this "Read Modify Write" mode, out of display data "Read" / "Write", any instructions except "Column Address Set" can be executed.

- The Sequence of Cursor Blink Display

(m) End

The “end” instruction cancels the read modify write mode and makes the column address return to the initial value just before “read modify write” is started.

A0	RDb	WRb	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	1	1	0	1	1	1	0

(n) Reset

This instruction reset the LSI to the following status, however it doesn't change the contents of the DDRAM. Please be careful that it can't be substituted for the reset operation by using of the RESb terminal.

Reset status by “reset” instruction:

- 1: Static indicator register : D₁,D₀ = “0,0”
- 2: Read modify write off
- 3: Initial display line address : 00_H
- 4: Column address : 00_H
- 5: Page address : 0 page
- 6: Common direction register : D₃=”0”(Normal mode)
- 7: Feedback resistors ratio : D₂,D₁,D₀ = “0,0,0”
- 8: EVR mode off and EVR register : D₅,D₄,D₃,D₂,D₁,D₀ = “1,0,0,0,0,0”
- 9: n-line inverse drive register : D₃,D₂,D₁,D₀ = “0,0,0,0”
- 10: Test mode reset (Test mode 1 and Test mode 2)

The DD RAM is not affected of this initialization.

A0	RDb	WRb	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	1	1	0	0	0	1	0

(o) Common Driver Direction Select

This instruction selects common driver direction.
Please refer to (1-7) common driver direction for more detail.

A0	RDb	WRb	D7	D6	D5	D4	D3	D2	D1	D0	
0	1	0	1	1	0	0	D ₃	*	*	*	(*: Don't Care)

- D₃ 0: Normal Common driver direction (C₀ to C₆₃) or (C₁₆ to C₄₇)
- 1: Inverse Common driver direction (C₆₃ to C₀) or (C₄₇ to C₁₆)

(p) Power Control Set

This instruction controls the status of internal power circuits. Please refer to the (1-9) LCD Driving Circuits (g) internal power circuits for more detail.

A0	RDb	WRb	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	0	0	1	0	1	A ₂	A ₁	A ₀

- A₂ 0: Voltage Converter Off
 1: Voltage Converter On
- A₁ 0: Voltage Regulator Off
 1: Voltage Regulator On
- A₀ 0: Voltage Followers Off
 1: Voltage Followers On

Note) The internal power supply must be Off when external power supply using.

* The wait time depends on the C₄ to C₈, C_{OUT} capacitors, and V_{DD} and V_{LCD} Voltage.
Therefore it requires the actual evaluation using the LCD module to get the correct time.

(q) Feedback Resistor Ratio Set

This instruction is used to determine the internal feedback resistor ratio.
Please refer to the (3-2) Voltage Adjust Circuits for more detail.

A0	RDb	WRb	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	0	0	1	0	0	A ₂	A ₁	A ₀

A ₂	A ₁	A ₁	Internal resistor ratio 1+(Rb/Ra)	V _{LCD} 1+(Rb/Ra)
0	0	0	4.5	Minimum
0	0	1	5.0	:
0	1	0	5.5	:
0	1	1	6.0	:
1	0	0	6.5	:
1	0	1	7.0	:
1	1	0	7.6	:
1	1	1	8.1	Maximum

(r) EVR Set

1) EVR mode set

This instruction sets the LSI into the EVR mode, and it is always used by the combination with “EVR register set”. The LSI can't accept any instructions except the “EVR register set” during the EVR set mode. This mode will be released after the “EVR register set” instruction.

A0	RDb	WRb	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	1	0	0	0	0	0	0	1

2) EVR Register Set

This instruction sets 6-bit data into the EVR register to determine the output voltage “V₅” of the internal voltage regulator.

A0	RDb	WRb	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	*	*	A ₅	A ₄	A ₃	A ₂	A ₁	A ₀

(*: Don't Care)

A ₅	A ₄	A ₃	A ₂	A ₁	A ₀	V _{LCD}
0	0	0	0	0	0	Minimum
0	0	0	0	0	1	:
:	:	:	:	:	:	:
:	:	:	:	:	:	:
1	1	1	1	1	1	Maximum

(s) Static Indicator

1) Static Indicator On/Off

This instruction selects static indicator turn-on or turn-off, and it is always used by the combination with the “static indicator register set”.

A0	RDb	WRb	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	1	0	1	0	1	1	0	D

D 0: Static Indicator Off
1: Static Indicator On

2) Static Indicator Register Set

A0	RDb	WRb	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	*	*	*	*	*	*	A ₁	A ₀

(*: Don't Care)

A ₁	A ₀	Indicator display Status
0	0	Off
0	1	On (Blink at 1.0s intervals)
1	0	On (Blink at 0.5s intervals)
1	1	On (Turn on at all time)

(t) Power Save

This instruction sets the LSI into the power save mode. This instruction is reducing operating current as well as static operations.

The internal status and the contents of the DDRAM will be remained just before the “Power save” instruction. In addition, the DDRAM can be accessed during the power save mode.

There are two power save modes, sleep mode and standby mode.

A0	RD _b	WR _b	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	1	0	1	0	1	0	0	D

D 0: Standby Mode
 1: Sleep Mode

<Sleep Mode>

All functions are halted so that its operating current is reduced as low as standby current.

All LCD system stops as follows,

- 1) Oscillator and internal power circuits stop.
- 2) All common and segment drivers output V_{DD} level.

<Standby Mode>

A part of functions are halted. The only static drive system as the indicator operates.

The LCD system except the static indicator stops as follows,

- 1) Internal power circuits stop. (Oscillator is operating.)
- 2) LCD driving is stopped. All common and segment drivers output V_{DD} level.
- 3) The only static indicator is working.

(u) Power Save Reset

This instruction releases the power save mode.

A0	RD _b	WR _b	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	1	1	1	0	0	0	0	1

(v) n-line Inverse Drive Register Set

This instruction specifies the number of n-line. Please refer to the (1-9)LCD Driving Circuits (e)Common timing generation Fig.2-1, Fig.2-2 for more detail.

A0	RDb	WRb	D7	D6	D5	D4	D3	D2	D1	D0

0	0	0	0	-(*)
0	0	0	1	2
0	0	1	0	3
⋮	⋮	⋮	⋮	⋮
1	1	1	0	15
1	1	1	1	16

(*) 2-frame alternating drive mode.

(w) n-line Inverse Drive Reset

This instruction releases n-line inversion, but does not change the contents of the n-line register.

A0	RDb	WRb	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	1	1	0	0	1	0	0

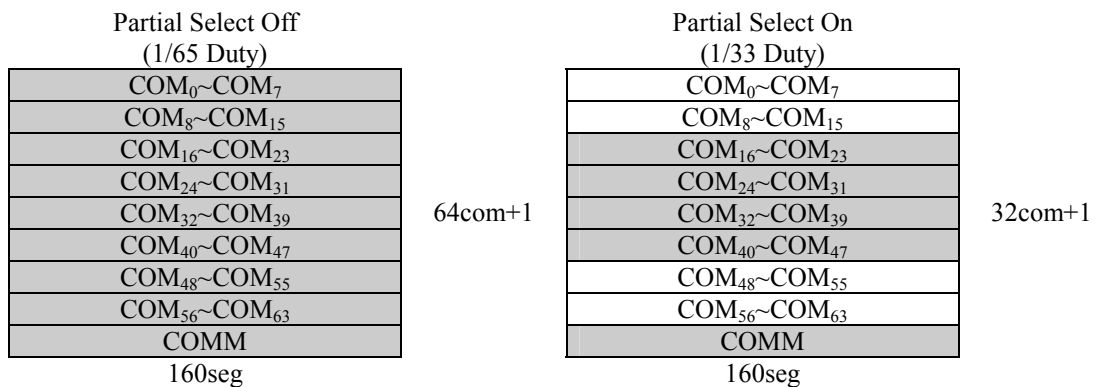

(x) Patial Select

This instruction starts the partial mode operation.

A0	RDb	WRb	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	0	1	0	0	0	1	D

- D 0: 1/65 Duty (Partial Select Off)
- 1: 1/33 Duty (Partial Select On)

Display structure by Partial Select On / Off

■ Active Display-block

(y) Internal Oscillation Circuit On

This setting is effective when M/S="1" and CLS="1".

A0	RDb	WRb	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	0	1	0	1	0	1	1

(z)NOP

Non Operation.

A0	RDb	WRb	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	1	1	0	0	0	1	1

(3) Internal power circuits

(3-1) Voltage converter

The voltage converter generates maximum 4x boosted negative-voltage from the voltage between V_{DD} and V_{SS2} . The boosted voltage is output from the V_{OUT} terminal.

The internal oscillator is required to be operating when using this converter, because the divided signal provided from the oscillator is used for the internal timing of this circuit.

The boosted voltage between V_{DD} and V_{OUT} must not exceed 18.0V.

The voltage converter requires external capacitors for boosting as shown in below.

- The boosted voltage and V_{DD} , V_{SS2}

$V_{DD}=+3V$

$V_{SS2}=0V$

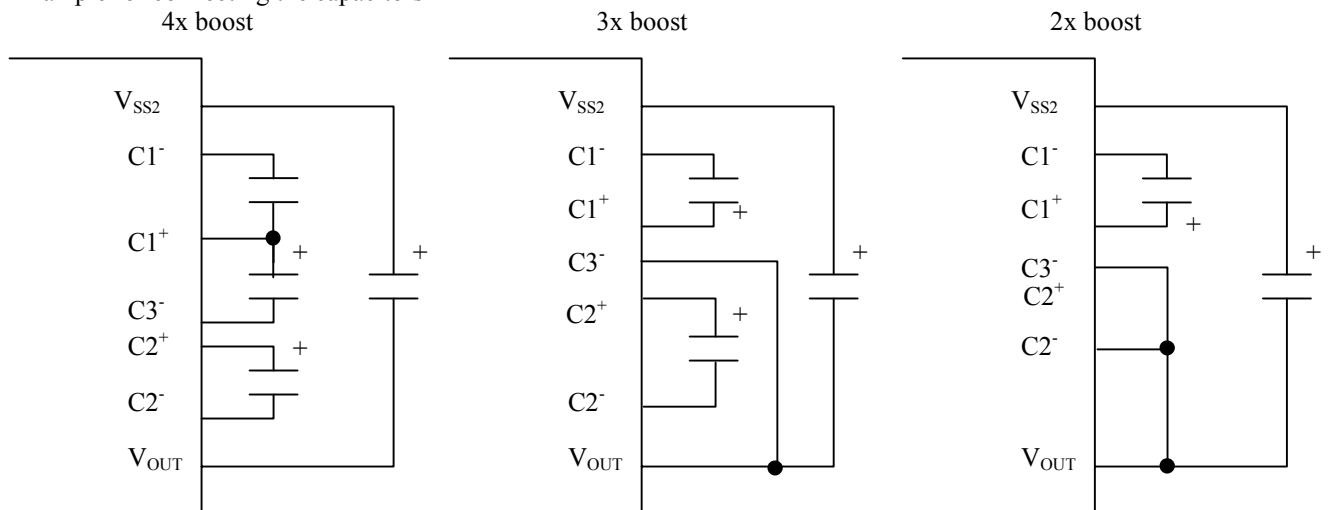

$V_{OUT}=-3V$

$V_{OUT}=-6V$

$V_{OUT}=-9V$

- Example for connecting the capacitors

(3-2) Voltage Adjust Circuits

The voltage adjust circuits is composed of the reference voltage circuit, 64-step E.V.R. and feedback resistors. The adjust circuits produces the LCD driving voltage V_5 on the V_5 terminal, using the V_{OUT} voltage supplied from the internal booster.

(a) Using Internal Feedback Resistors

LCD contrast can be fine-tuned by adjusting the V_5 voltage through setting the internal feedback resistors and the E.V.R. And the V_5 voltage is calculated from the foemula (1), where $|V_5| < |V_{OUT}|$.

$$\begin{aligned}
 V_{LCD} &= V_{DD} - V_5 && \text{----- (1)} \\
 &= (1 + (R_b/R_a)) \times V_{CON} && [V_{CON} = (EVR) \times (V_{REG})] \\
 &= (1 + (R_b/R_a)) \times (EVR) \times V_{REG} && [EVR = (n+99) / 162]
 \end{aligned}$$

V_{LCD} : LCD Driving Voltage V_{CON} : Contrast Control Voltage V_{REG} : Reference Voltage
 R_a, R_b : Feedback Resistors n : E.V.R. Setting Value

Fig.3-1 Voltage adjust circuits (Using internal feedback resistors)

The V_{REG} is the regulated voltage with temperature coefficient, as follows.

	Temperature Coefficient	V_{REG}
Internal Power Supply	0.05[%/°C] (Typ.)	2.11[V] (Typ.)

The V_5 is adjusted in 64-step by setting 6-bit data into the E.V.R. register, as follows.

E.V.R. Register		E.V.R. Value	V_{LCD}
00 _H	(0,0,0,0,0,0)	(99/162)	Minimum
01 _H	(0,0,0,0,0,1)	(100/162)	:
02 _H	(0,0,0,0,1,0)	(101/162)	:
:	:	:	:
:	:	:	:
:	:	:	:
3D _H	(1,1,1,1,0,1)	(160/162)	:
3E _H	(1,1,1,1,1,0)	(161/162)	:
3F _H	(1,1,1,1,1,1)	(162/162)	Maximum

The ratio of the Ra and Rb (Ra/Rb) is selected out of 8 options by the "Feedback Resistor set" instruction.

The Register of Feedback Resistor		$1+(Rb/Ra)$	V_{LCD}
00 _H	(0,0,0)	4.5	Minimum
01 _H	(0,0,1)	5.0	:
02 _H	(0,1,0)	5.5	:
03 _H	(0,1,1)	6.0	:
04 _H	(1,0,0)	6.5	:
05 _H	(1,0,1)	7.0	:
06 _H	(1,1,0)	7.6	:
07 _H	(1,1,1)	8.1	Maximum

* : The resistance of the feedback resistors has a certain amount of error. If it may impact on the LCD contrast external feedback resistors should be considered.

(b) Using External Feedback Resistors

When IRS="L", the V_5 voltage can be adjusted by the external feedback resistors. And the E.V.R. function is applied in combination, and fine-tunes the LCD contrast through software. The V_5 voltage is calculated from the formula (2), where $|V_5| < |V_{OUT}|$.

$$\begin{aligned}
 V_{LCD} &= V_{DD} - V_5 && \text{----- (2)} \\
 &= (1 + (Rb/Ra)) \times V_{CON} && [V_{CON} = (EVR) \times (V_{REG})] \\
 &= (1 + (Rb/Ra)) \times (EVR) \times V_{REG} && [EVR = (n+99) / 162]
 \end{aligned}$$

V_{LCD} : LCD Driving Voltage V_{CON} : Contrast Control Voltage V_{REG} : Reference Voltage
 Ra, Rb : Feedback Resistors n : E.V.R. Setting Value

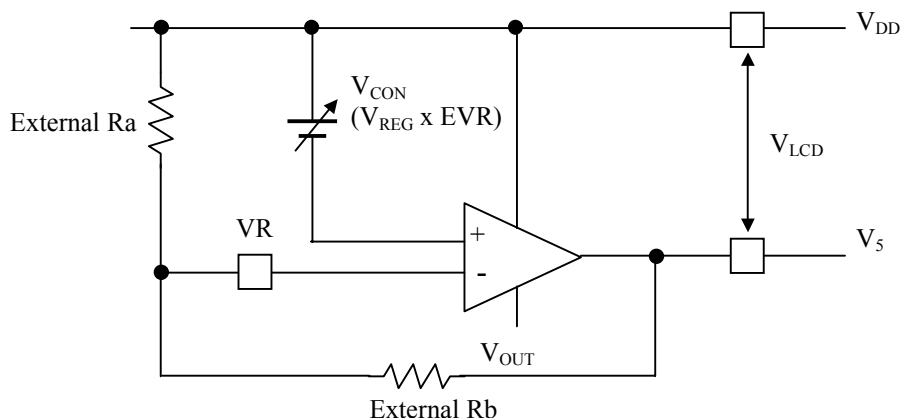

Fig.3-2 Voltage adjust circuits (Using external feedback resistors)

* : When using either the internal feedback resistors or E.V.R. or both, the LCD voltage generator and the buffer amplifiers must be activated.

* : The VR terminal is only used for the external feedback resistors. This must be open when using the internal feedback resistors.

<Design example for the adjustable range / Reference> Using external resistors(Not using variable resistor), $V_{LCD}=7V$

Power supply $V_{DD}=3.0V$, $V_{SS}=0V$

E.V.R. register = (D₅,D₄,D₃,D₂,D₁,D₀) : (1,0,0,0,0)

By formula (2)

$$\begin{aligned} V_{LCD} &= V_{DD}-V_5 \\ &= (1+(Rb/Ra)) \times (EVR) \times V_{REG} \\ 7[V] &= (1+(Rb/Ra)) \times (130/162) \times 2.1 \end{aligned}$$

$$Rb/Ra = 3.15 \quad \text{----- (3)}$$

In case of the current value sets 5uA, which flows to Ra and Rb

$$Ra+Rb = 1.4M\Omega \quad \text{----- (4)}$$

By formula (3), (4)

$$\begin{aligned} Ra+3.15Ra &= 1.4M\Omega \\ Ra &= 337k\Omega \quad \text{----- (5)} \end{aligned}$$

Therefore,

$$\begin{aligned} Rb &= 1.4M\Omega - 337k\Omega \\ &= 1063k\Omega \quad \text{----- (6)} \end{aligned}$$

The adjustable range and the step voltage are calculated as follows in the formula (2).

- In case of setting 00_H in the E.V.R. register,

$$\begin{aligned} V_{LCD} &= (1+(Rb/Ra)) \times (EVR) \times V_{REG} \\ &= (1+3.15) \times [(99/162) \times 2.1] \\ &= 5.33V \end{aligned}$$

- In case of setting 3F_H in the E.V.R. register,

$$\begin{aligned} V_{LCD} &= (1+(Rb/Ra)) \times (EVR) \times V_{REG} \\ &= (1+3.15) \times [(162/162) \times 2.1] \\ &= 8.72V \end{aligned}$$

	(min.) 00 _H	(max.) 3F _H
V _{LCD} Adjustable Range	5.33 -----	8.72[V]
V _{LCD} Step Voltage	54	[mV]

*: In case of $V_{DD}=3V$

(3-3) LCD Driving Voltage Generation Circuits

The LCD driving bias voltage of V_1, V_2, V_3, V_4 are generated internally by dividing the V_{LCD} ($V_{LCD}=V_{DD}-V_5$) voltage with the internal bleeder resistance. And it is supplied to the LCD driving circuits after the impedance conversion with voltage follower circuit.

As shown in Fig 4, Five capacitors are required to connect to each LCD driving voltage terminal for voltage stabilizing. And the value of capacitors $C_4, C_5, C_6, C_7,$ and C_8 are determined depending on the actual LCD panel display evaluation.

Fig.4 LCD Driving Voltage Generation Circuits

*1 Short wiring or sealed wiring to the VR terminal is required due to the high impedance of VR terminal.

*2 Following connection of V_{OUT} is required when external power supply using.

(1): When $V_{SS} > V_5$ --- $V_{OUT}=V_5$

(2): When $V_{SS} < V_5$ --- $V_{OUT}=V_{SS}$

Reference set up value
 $V_{LCD}=V_{DD}-V_5=7.0$ to $10.5V$

C_{OUT}	~1.0uF
$C_1 \sim C_3, C_8$	~1.0uF
$C_4 \sim C_7$	0.1 ~ 0.47uF
R1	225kΩ
R2	112kΩ
R3	1.063MΩ

(4) MPU interface

(4-1) Interface type selection

NJU6655 interfaces with MPU by 8-bit bidirectional data bus (D₇ to D₀) or serial (SI:D₇). The 8 bit parallel or serial interface is determined by a condition of the P/S terminal connecting to "H" or "L" level as shown in Table 5. In case of the serial interface, status and RAM data read out operation is impossible.

Table.5 Relation between P/S terminal and each I/O terminal

P/S	Type	CS ₁ b	A0	RDb	WRb	C86	SI(D ₇)	SCL(D ₆)	D ₀ ~D ₅
H	Parallel	CS ₁ b	A0	RDb	WRb	C86	D ₇	D ₆	D ₀ ~D ₅
L	Serial	CS ₁ b	A0	-	-	-	SI	SCL	Hi-Z

“Hi-Z” : Hi-impedance “-“ : They should be fixed to “H” or “L”.

Parallel Interface

The **NJU6655** interfaces to 68 or 80 type MPU directly when the parallel interface (P/S="H") is selected. 68 type MPU or 80 is determined by the condition of C86 terminal connecting to "H" or "L" as shown in Table 6.

Table.6 Relation between C86 terminal and each I/O terminal

C86	Type	CS ₁ b	A0	RDb	WRb	D ₀ ~D ₇
H	68 type MPU	CS ₁ b	A0	E	R/W	D ₀ ~D ₇
L	80 type MPU	CS ₁ b	A0	RDb	WRb	D ₀ ~D ₇

(4-2) Discrimination of Data Bus Signal

The **NJU6655** discriminates the mean of signal on the data bus by the combination of A0, E, R/W, and (RDb,WRb) signals as shown in Table 7.

Table.7 Relation between A0 terminal and 68/80 type terminal

Common	68 type	80 type		Function
	R/W	RDb	WRb	
A0	H	L	H	Read Display Data
	H	H	L	Write Display Data
	L	L	H	Status Read
	L	H	L	Write into the Register(Instruction)

(4-3) Serial Interface (P/S="L")

Serial interface circuits consist of 8 bits shift register and 3 bits counter. SI and SCL input are activated when the chip select terminal CS_{1b} set to "L", CS₂ set to "H" and P/S terminal set to "L". The 8 bits shift register and 3 bits counter are reset to the initial condition when the chip is not selected.

The data input from SI terminal is MSB first like as the order of D₇, D₆, - - - D₀, and the data are entered into the shift register synchronizing with the rise edge of the serial clock SCL. The data in the shift register are converted to parallel data at the 8th serial clock rise edge input.

Discrimination of the display data or instruction of the serial input data is executed by the condition of A0 at the 8th serial clock rise edge. A0="H" is display data and A0="L" is instruction. When RES_b terminal becomes "L" or CS_{1b} terminal becomes "H" (CS₂ terminal becomes "L") before 8th serial clock rise edge, NJU6655 recognizes them as a instruction data incorrectly. Therefore a unit of serial data must be structured by 8-bit.

The time chart for the serial interface is shown in Fig. 5. To avoid the noise trouble, the short wiring is required for the SCL input.

Note) The read out function, such as the status or RAM data read out, is not supported in this serial interface.

Fig.5 Signal chart of serial interface

(4-4) Access to the Display Data RAM and Internal Register

The NJU6655 is operating as one of pipe-line processor by the bus-holder connecting to the internal data bus to adjust the operation frequency between MPU and the Display Data RAM or Internal Register.

For example, when the MPU reads out the data from the Display Data RAM, the read out data in the data read cycle (dummy read) is held in the bus-holder, then it is read out from the bus-holder to the system bus at the next data read cycle. When the MPU writes the data into the Display Data RAM, the data is held in the bus-holder, then it is written into the Display Data RAM by the next data write cycle.

Therefore high speed data transmission between MPU and NJU6655 is available because of it is not limited by the t_{ACC} and t_{DS} as display data RAM access time and is limited by the system cycle time (R) or (W).

If the cycle time is not be kept in the MPU operation, NOP should be inserted to the system instead of the waiting operation.

The read out operation does not read out the data in the pointed address just after the address set operation. And second read out operation can read out the data correctly from the pointed address.

Therefore, one dummy read operation is required after address setting or write cycle as shown in Fig. 6.

The example of Read Modify Write operation is mentioned in (2-1) Instruction (1)The sequence of inverse display.

● Write Operation

● Read Operation

Fig.6 Relation between display data write/read and internal timing

(4-5) Chip select

CS_1b , CS_2 are Chip Select terminals. In case of $CS_1b="L"$ and $CS_2="H"$, the interface with MPU is available. In case of $CS_1b="H"$ or $CS_2="L"$, the D_0 to D_7 are high impedance and A_0 , RDb , WRb , $D_7(SI)$ and $D_6(SCL)$ inputs are ignored. If the serial interface is selected when $CS_1b="H"$ or $CS_2="L"$, the shift register and the counter are reset. However, the reset is always operated in any conditions of CS_1b and CS_2 .

■ ABSOLUTE MAXIMUM RATINGS

(Ta=25°C)

PARAMETER	SYMBOL	RATINGS	UNIT
Supply Voltage (1)	V _{DD}	-0.3 to +7.0	V
Supply Voltage (2) (When using 3x voltage converter) (When using 4x voltage converter)	V _{SS2}	-7.0 to +0.3 -6.0 to +0.3 -4.5 to +0.3	V
Supply Voltage (3)	V ₅ , V _{OUT}	-18.0 to +0.3	V
Supply Voltage (4)	V ₁ , V ₂ , V ₃ , V ₄	V ₅ to +0.3	V
Input Voltage	V _{IN}	-0.3 to V _{DD} + 0.3	V
Output Voltage	V _{OUT}	-0.3 to V _{DD} + 0.3	V
Operating Temperature	T _{opr}	-30 to +80	°C
Storage Temperature (TCP) (Chip)	T _{stg}	-55 to +100 -55 to +125	°C

Note 1) V_{SS2}, V₁ to V₅, V_{OUT} voltage values are specified as V_{DD} = 0V.

Note 2) The relation of V_{DD} ≥ V₁ ≥ V₂ ≥ V₃ ≥ V₄ ≥ V₅ > V_{OUT} ; V_{DD} > V_{SS} ≥ V_{OUT} must be maintained.

In case of inputting external LCD driving voltage, LCD drive voltage should start supplying to **NJU6655** at the mean time of turning on V_{DD} power supply or after turned on V_{DD}.

In use of the voltage boost circuit, the condition that the supply voltage : 18V ≥ V_{DD} - V_{OUT} is necessary.

Note 3) If the LSI are used on condition beyond the absolute maximum rating, the LSI may be destroyed. Using LSI within electrical characteristics is strongly recommended for normal operation. Use beyond the electric characteristics conditions will cause malfunction and poor reliability.

Note 4) Decoupling capacitor should be connected between V_{DD} and V_{SS} due to the stabilized operation for the voltage converter.

DC Electrical Characteristics

(V_{DD}=2.4 to 3.6V, V_{SS}=0V, Ta= -30 to 80°C)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNIT	NOTE
Power Supply (1)	V _{DD}	Recommend→ Possible→	2.4	-	3.6	V	5
			2.4	-	5.5	V

Input Terminal Capacitance	C _{IN}	Ta=25°C	-	5	8	pF	7
Oscillation Frequency	f _{OSC}	V _{DD} =3V, Ta=25°C	17.0	20.8	24.6	kHz	
Display Clock Frequency	f _{CL}	External input	4.25	5.20	6.15	kHz	

Voltage Booster	Input Voltage	V _{SS2}	V _{DD} common, 3-times boost	-6.0	-	-2.4	V	
			V _{DD} common, 4-times boost	-4.5	-	-2.4		
	Output Voltage	V _{OUT}	V _{DD} common	-18.0	-	-	V	
	On-resistance	R _{QUAD}	4-times boost, C ₁ -C ₃ , C _{OUT} =1uF V _{DD} =3V, V _{SS} =V _{SS2}		2.5	3.5	kΩ	
	Adjustment Range LCD Driving Voltage	V _{OUT2}	Voltage boost operation off External power supply	-18.0	-	-6.0	V	8
	Voltage Follower Operating Voltage	V ₅	Voltage adjustment circuit off External power supply	-18.0	-	-4.5	V	
	Operating current	I _{DDQ1}	Power save mode (Sleep mode)		0.01	5.0	uA	
			Power save mode (Standby mode)		4	10		
		I _{DD1}	V _{DD} =3V, V ₅ =-11V		130	200	uA	9
	I _{DD2}	All COM/SEG open, Without MPU access, Checker flag display		20	50			
	Reference Voltage	V _{REF}	Ta=25°C	2.04	2.15	2.26	V	
Temperature Coefficient	TC	V _{DD} =3V		-0.05		%/°C		

Note 5) Although the NJU6655 can operate in wide range of the operating voltage, it shall not be guaranteed in a sudden voltage fluctuation during the access with MPU.

Note 6) R_{ON} is the resistance values in supplying 0.1V voltage-difference between power supply terminals (V₁, V₂, V₃, V₄) and each output terminals (common / segment). This is specified within the range of Operating Voltage (2).

Note 7) Apply to A0, D₇ to D₀, RDb, WRb, CS_{1b}, CS₂, RESb, C86 and P/S terminals.

Note 8) The voltage adjustment circuit controls V₅ within the range of the voltage follower operating voltage.

Note 9) Each operating current shall be defined as being measured in the following condition.

Symbol	Power Control			Operating Condition			External Voltage Supply (Input Terminal)
	D ₂	D ₁	D ₀	Voltage converter	Voltage regulator	Voltage followers	
I _{DD1}	1	1	1	On	On	On	Use(V _{SS2})
I _{DD2}	0	0	0	Off	Off	Off	Use(V _{OUT} , V ₁ ~V ₅)
