

PCI6621/PCI6611/PCI6421/PCI6411
Dual/Single Socket CardBus and UltraMedia Controller
With Dedicated Flash Media and Smart Card Sockets

Data Manual

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

1 Introduction

The Texas Instruments PCI6621 controller is an integrated dual-socket UltraMedia PC Card controller, Smart Card controller, and flash media controller. This high-performance integrated solution provides the latest in PC Card, Smart Card, Secure Digital (SD), MultiMediaCard (MMC), Memory Stick/PRO, SmartMedia, and XD technology.

The Texas Instruments PCI6421 controller is an integrated dual-socket UltraMedia PC Card controller, and flash media controller. This high-performance integrated solution provides the latest in PC Card, SD, MMC, Memory Stick/PRO, SmartMedia, and XD technology.

The Texas Instruments PCI6611 controller is an integrated single-socket UltraMedia PC Card controller, Smart Card controller, and flash media controller. This high-performance integrated solution provides the latest in PC Card, Smart Card, SD, MMC, Memory Stick/PRO, SmartMedia, and XD technology.

The Texas Instruments PCI6411 controller is an integrated single-socket UltraMedia PC Card controller and flash media controller. This high-performance integrated solution provides the latest in PC Card, SD, MMC, Memory Stick/PRO, SmartMedia, and XD technology.

For the remainder of this document, the PCI6x21 controller refers to the PCI6621 and PCI6421 controllers, and the PCI6x11 controller refers to the PCI6611 and PCI6411 controllers.

1.1 Controller Functional Description

1.1.1 PCI6621 Controller

The PCI6621 controller is a five-function PCI controller compliant with *PCI Local Bus Specification*, Revision 2.3.

Functions 0 and 1 provide the independent PC Card socket controllers compliant with the *PC Card Standard* (Release 8.1). The PCI6621 controller provides features that make it the best choice for bridging between the PCI bus and PC Cards, and supports any combination of Smart Card, Flash Media, 16-bit, CardBus, and USB custom card interface PC Cards in the two sockets, powered at 5 V or 3.3 V, as required.

All card signals are internally buffered to allow hot insertion and removal without external buffering. The PCI6621 controller is register compatible with the Intel 82365SL-DF ExCA controller. The PCI6621 internal data path logic allows the host to access 8-, 16-, and 32-bit cards using full 32-bit PCI cycles for maximum performance. Independent buffering and a pipeline architecture provide an unsurpassed performance level with sustained bursting. The PCI6621 controller can be programmed to accept posted writes to improve bus utilization.

Function 3 of the PCI6621 controller is a PCI-based Flash Media controller that supports Memory Stick, Memory Stick-Pro, SmartMedia, XD, SD, and MMC cards. This function controls communication with these Flash Media cards through a passive PC Card adapter or through a dedicated Flash Media socket. In addition, this function includes DMA capabilities for improved Flash Media performance.

Function 4 of the PCI6621 controller is a PCI-based SD host controller that supports MMC, SD, and SDIO cards. This function controls communication with these Flash Media cards through a passive PC Card adapter or through a dedicated Flash Media socket. In addition, this function is compliant with the *SD Host Controller Standard Specification* and includes both DMA capabilities and support for SD suspend/resume.

Function 5 of the PCI6621 controller is a PCI-based Smart Card controller used for communication with Smart Cards inserted in PC Card adapters. Utilizing Smart Card technology from Gemplus, this function provides compatibility with many different types of Smart Cards.

1.1.2 PCI6421 Controller

The PCI6421 controller is a four-function PCI controller compliant with *PCI Local Bus Specification*, Revision 2.3.

Functions 0 and 1 provide the independent PC Card socket controllers compliant with the *PC Card Standard* (Release 8.1). The PCI6421 controller provides features that make it the best choice for bridging between the PCI bus and PC Cards, and supports any combination of Smart Card, Flash Media, 16-bit, CardBus, and USB custom card interface PC Cards in the two sockets, powered at 5 V or 3.3 V, as required.

All card signals are internally buffered to allow hot insertion and removal without external buffering. The PCI6421 controller is register compatible with the Intel 82365SL-DF ExCA controller. The PCI6421 internal data path logic allows the host to access 8-, 16-, and 32-bit cards using full 32-bit PCI cycles for maximum performance. Independent buffering and a pipeline architecture provide an unsurpassed performance level with sustained bursting. The PCI6421 controller can be programmed to accept posted writes to improve bus utilization.

Function 3 of the PCI6421 controller is a PCI-based Flash Media controller that supports Memory Stick, Memory Stick-Pro, SmartMedia, XD, SD, and MMC cards. This function controls communication with these Flash Media cards through a passive PC Card adapter or through a dedicated Flash Media socket. In addition, this function includes DMA capabilities for improved Flash Media performance.

Function 4 of the PCI6421 controller is a PCI-based SD host controller that supports MMC, SD, and SDIO cards. This function controls communication with these Flash Media cards through a passive PC Card adapter or through a dedicated Flash Media socket. In addition, this function is compliant with the *SD Host Controller Standard Specification* and includes both DMA capabilities and support for SD suspend/resume.

1.1.3 PCI6611 Controller

The PCI6611 controller is a four-function PCI controller compliant with *PCI Local Bus Specification*, Revision 2.3.

Function 0 provides an independent PC Card socket controller compliant with the *PC Card Standard* (Release 8.1). The PCI6611 controller provides features that make it the best choice for bridging between the PCI bus and PC Cards, and supports Smart Card, Flash Media, 16-bit, CardBus or USB custom card interface PC Cards, powered at 5 V or 3.3 V, as required.

All card signals are internally buffered to allow hot insertion and removal without external buffering. The PCI6611 controller is register compatible with the Intel 82365SL-DF ExCA controller. The PCI6611 internal data path logic allows the host to access 8-, 16-, and 32-bit cards using full 32-bit PCI cycles for maximum performance. Independent buffering and a pipeline architecture provide an unsurpassed performance level with sustained bursting. The PCI6611 controller can be programmed to accept posted writes to improve bus utilization.

Function 3 of the PCI6611 controller is a PCI-based Flash Media controller that supports Memory Stick, Memory Stick-Pro, SmartMedia, XD, SD, and MMC cards. This function controls communication with these Flash Media cards through a passive PC Card adapter or through a dedicated Flash Media socket. In addition, this function includes DMA capabilities for improved Flash Media performance.

Function 4 of the PCI6611 controller is a PCI-based SD host controller that supports MMC, SD, and SDIO cards. This function controls communication with these Flash Media cards through a passive PC Card adapter or through a dedicated Flash Media socket. In addition, this function is compliant with the *SD Host Controller Standard Specification* and includes both DMA capabilities and support for SD suspend/resume.

Function 5 of the PCI6611 controller is a PCI-based Smart Card controller used for communication with Smart Cards inserted in PC Card adapters. Utilizing Smart Card technology from Gemplus, this function provides compatibility with many different types of Smart Cards.

1.1.4 PCI6411 Controller

The PCI6411 controller is a three-function PCI controller compliant with *PCI Local Bus Specification*, Revision 2.3.

Function 0 provides an independent PC Card socket controller compliant with the *PC Card Standard* (Release 8.1). The PCI6411 controller provides features that make it the best choice for bridging between the PCI bus and PC Cards, and supports Smart Card, Flash Media, 16-bit, CardBus or USB custom card interface PC Cards, powered at 5 V or 3.3 V, as required.

All card signals are internally buffered to allow hot insertion and removal without external buffering. The PCI6411 controller is register compatible with the Intel 82365SL-DF ExCA controller. The PCI6411 internal data path logic allows the host to access 8-, 16-, and 32-bit cards using full 32-bit PCI cycles for maximum performance. Independent buffering and a pipeline architecture provide an unsurpassed performance level with sustained bursting. The PCI6411 controller can be programmed to accept posted writes to improve bus utilization.

Function 3 of the PCI6411 controller is a PCI-based Flash Media controller that supports Memory Stick, Memory Stick-Pro, SmartMedia, XD, SD, and MMC cards. This function controls communication with these Flash Media cards through a passive PC Card adapter or through a dedicated Flash Media socket. In addition, this function includes DMA capabilities for improved Flash Media performance.

Function 4 of the PCI6411 controller is a PCI-based SD host controller that supports MMC, SD, and SDIO cards. This function controls communication with these Flash Media cards through a passive PC Card adapter or through a dedicated Flash Media socket. In addition, this function is compliant with the *SD Host Controller Standard Specification* and includes both DMA capabilities and support for SD suspend/resume.

1.1.5 Multifunctional Terminals

Various implementation-specific functions and general-purpose inputs and outputs are provided through eight multifunction terminals. These terminals present a system with options in PC/PCI DMA, PCI LOCK, serial and parallel interrupts, PC Card activity indicator LEDs, flash media LEDs, and other platform-specific signals. PCI compliant general-purpose events may be programmed and controlled through the multifunction terminals, and an ACPI-compliant programming interface is included for the general-purpose inputs and outputs.

1.1.6 PCI Bus Power Management

The PCI6x21/PCI6x11 controller is compliant with the latest *PCI Bus Power Management Specification*, and provides several low-power modes, which enable the host power system to further reduce power consumption.

1.1.7 Power Switch Interface

The PCI6x21/PCI6x11 controller also has a three-pin serial interface compatible with the Texas Instruments TPS2228 (default), TPS2226, TPS2224, and TPS2223A power switches. All three power switches provide power to the CardBus socket(s) on the PCI6x21/PCI6x11 controller. The power to each dedicated socket is controlled through separate power control pins. Each of these power control pins can be connected to an external 3.3-V power switch.

1.2 Features

The PCI6x21/PCI6x11 controller supports the following features:

- *PC Card Standard 8.1* compliant
- *PCI Bus Power Management Interface Specification 1.1* compliant
- *Advanced Configuration and Power Interface (ACPI) Specification 2.0* compliant
- *PCI Local Bus Specification Revision 2.3* compliant
- PC 98/99 and PC2001 compliant
- Windows Logo Program 2.0 compliant
- *PCI Bus Interface Specification for PCI-to-CardBus Bridges*
- 1.5-V core logic and 3.3-V I/O cells with internal voltage regulator to generate 1.5-V core V_{CC}
- Universal PCI interfaces compatible with 3.3-V and 5-V PCI signaling environments
- Supports PC Card or CardBus with hot insertion and removal
- Supports 132-MBps burst transfers to maximize data throughput on both the PCI bus and the CardBus

- Supports serialized IRQ with PCI interrupts
- Programmable multifunction terminals
- Many interrupt modes supported
- Serial ROM interface for loading subsystem ID and subsystem vendor ID
- ExCA-compatible registers are mapped in memory or I/O space
- Intel 82365SL-DF register compatible
- Supports ring indicate, $\overline{\text{SUSPEND}}$, and PCI $\overline{\text{CLKRUN}}$ protocols and PCI bus Lock ($\overline{\text{LOCK}}$)
- Provides VGA/palette memory and I/O, and subtractive decoding options, LED activity terminals
- Compliant with Intel *Mobile Power Guideline 2000*
- Power-down features to conserve energy in battery-powered applications include: automatic device power down during suspend
- PCI power-management D0, D1, D2, and D3 power states
- Advanced submicron, low-power CMOS technology

1.4 Trademarks

Intel is a trademark of Intel Corporation.

TI and MicroStar BGA are trademarks of Texas Instruments.

i.LINK is a trademark of Sony Corporation of America.

Memory Stick is a trademark of Sony Kabushiki Kaisha TA Sony Corporation, Japan.

Other trademarks are the property of their respective owners.

1.5 Terms and Definitions

Terms and definitions used in this document are given in Table 1–1.

Table 1–1. Terms and Definitions

TERM	DEFINITIONS
AT	AT (advanced technology, as in PC AT) attachment interface
ATA driver	An existing host software component that loads when any flash media adapter and card is inserted into a PC Card socket. This driver is logically attached to a predefined CIS provided by the PCI6x21/PCI6x11 controller when the adapter and media are both inserted.
CIS	Card information structure. Tuple list defined by the PC Card standard to communicate card information to the host computer
CSR	Control and status register
Flash Media	SmartMedia, Memory Stick, MS/PRO, xD, MMC, or SD/MMC Flash operating in an ATA compatible mode
ISO/IEC 7816	The Smart Card standard
Memory Stick™	A small-form-factor flash interface that is defined, promoted, and licensed by Sony
Memory Stick Pro™	Memory Stick Version 2.0, same physical dimensions of MS with higher speed data exchange and higher data capacity than conventional Memory Stick.
MMC	MultiMediaCard. Specified by the MMC Association, and scope is encompassed by the SD Flash specification.
PCMCIA	Personal Computer Memory Card International Association. Standards body that governs the PC Card standards
RSVD	Reserved for future use
SD Flash	Secure Digital Flash. Standard governed by the SD Association
Smart Card	The name applied to ID cards containing integrated circuits, as defined by ISO/IEC 7816-1
SPI	Serial peripheral interface, a general-purpose synchronous serial interface. For more information, see the <i>Multimedia Card System Specification, version 3.2</i> .
SSFDC	Solid State Floppy Disk Card. The SSFDC Forum specifies SmartMedia
TI Smart Card driver	A qualified software component provided by Texas Instruments that loads when an UltraMedia-based Smart Card adapter is inserted into a PC Card slot. This driver is logically attached to a CIS provided by the PCI6621 when the adapter and media are both inserted.
UltraMedia™	<i>De facto</i> industry standard promoted by Texas Instruments that integrates CardBus, Smart Card, Memory Stick, MultiMediaCard/Secure Digital and SmartMedia functionality into one controller.
xD	Extreme Digital, small form factor flash based on SmartMedia cards, developed by Fuji Film and Olympus Optical.

1.6 Ordering Information

ORDERING NUMBER	NAME	VOLTAGE	PACKAGE
PCI6621	Dual Socket CardBus and UltraMedia Controller with Dedicated Flash Media Socket	3.3-V, 5-V tolerant I/Os	288-ball PBGA (GHK or ZHK)

Figure 2–4. PCI6411 GHK/ZHK-Package Terminal Diagram

Table 2–1 lists the terminal assignments arranged in terminal-number order, with corresponding signal names for both CardBus and 16-bit PC Cards for the PCI6421 and PCI6621 GHK packages. Table 2–2 and Table 2–3 list the terminal assignments arranged in alphanumeric order by signal name, with corresponding terminal numbers for the GHK package; Table 2–2 is for CardBus signal names and Table 2–3 is for 16-bit PC Card signal names.

Terminal E5 on the GHK package is an identification ball used for device orientation.

2.1 Detailed Terminal Descriptions

Please see Table 2–4 through Table 2–19 for more detailed terminal descriptions. The following list defines the column headings and the abbreviations used in the detailed terminal description tables.

- I/O Type:
 - I = Digital input
 - O = Digital output
 - I/O = Digital input/output
 - AI = Analog input
 - PWR = Power
 - GND = Ground
- Input/Output Description:
 - AF = Analog feedthrough
 - TTLI1 = 5-V tolerant TTL input buffer
 - TTLI2 = 5-V tolerant TTL input buffer with hysteresis
 - TTLO1 = 5-V tolerant low-noise 4-mA TTL output buffer
 - PCII1 = 5-V tolerant PCI input buffer
 - PCII2 = 5-V tolerant PCI input buffer
 - PCII3 = 5-V tolerant PCI input buffer
 - PCII4 = 5-V tolerant PCI input buffer
 - PCII5 = 5-V tolerant PCI input buffer
 - PCIO2 = 5-V tolerant PCI output buffer
 - PCIO4 = 5-V tolerant PCI output buffer
 - PCIO5 = 5-V tolerant PCI output buffer
 - LVCI1 = LVCMOS input buffer
 - LVCO1 = Low-noise 4-mA LVCMOS open drain output buffer
 - LVCO2 = Low-noise 4-mA LVCMOS open drain output buffer
 - LVCO3 = Low-noise 8-mA LVCMOS open drain output buffer
- PU/PD signifies whether the terminal has an internal pullup or pulldown resistor. These pullups are disabled and enabled by design when appropriate to preserve power.
 - PD1 = 20- μ A failsafe pulldown
 - PD2 = 100- μ A failsafe pulldown
 - PU1 = 200- μ A pullup
 - PU2 = 100- μ A pullup
 - PU3 = 100- μ A pullup
 - PU4 = 100- μ A pullup
 - SW = Switchable 50- μ A pullup/200- μ A pulldown implemented depending on situation
- Power Rail signifies which rail the terminal is clamped to for protection.
- External Components signifies any external components needed for normal operation.
- Pin Strapping (If Unused) signifies how the terminal must be implemented if its function is not needed.

The terminals are grouped in tables by functionality, such as PCI system function, power-supply function, etc. The terminal numbers are also listed for convenient reference.

Table 2–4. Power Supply Terminals

Output description, internal pullup/pulldown resistors, and the power rail designation are not applicable for the power supply terminals.

TERMINAL		DESCRIPTION	I/O TYPE	INPUT	EXTERNAL COMPONENTS	PIN STRAPPING (IF UNUSED)
NAME	NUMBER					
AGND	N12, U14, U16	Analog circuit ground terminals	GND			NA
AVDD	R13, R14, V17	Analog circuit power terminals. A parallel combination of high frequency decoupling capacitors near each terminal is suggested, such as 0.1 μ F and 0.001 μ F. Lower frequency 10- μ F filtering capacitors are also recommended. These supply terminals are separated from VDPLL_33 internal to the controller to provide noise isolation. They must be tied to a low-impedance point on the circuit board.	GND		0.1- μ F, 0.001- μ F, and 10- μ F capacitors tied to AGND	NA
GND	G07, G08, G13, H13, J09, J10, J11, K09, K10, K11, L08, L09, L10, L11, L12, M08	Digital ground terminal	GND			NA
VCC	H08, H09, H10, H11, H12, J08, J12, K08, K12, M07, M09, M10, M12, N07	Power supply terminal for I/O and internal voltage regulator	PWR			NA
VCCA	A05, A11	Clamp voltage for PC Card A interface. Matches card A signaling environment, 5 V or 3.3 V	PWR			Float
VCCB	D19, K19	Clamp voltage for PC Card B interface. Matches card B signaling environment, 5 V or 3.3 V	PWR			Float
VCCP	W03, W10	Clamp voltage for PCI and miscellaneous I/O, 5 V or 3.3 V	PWR			NA
VDPLL_15	T18	1.5-V PLL circuit power terminal. An external capacitor (0.1 μ F recommended) must be placed between terminals T18 and T17 (VSSPLL) when the internal voltage regulator is enabled ($VR_EN = 0$ V). When the internal voltage regulator is disabled, 1.5-V must be supplied to this terminal and a parallel combination of high frequency decoupling capacitors near the terminal is suggested, such as 0.1 μ F and 0.001 μ F. Lower frequency 10- μ F filtering capacitors are also recommended.			0.1- μ F, 0.001- μ F, and 10- μ F capacitors tied to VSPLL	NA
VDPLL_33	V19	3.3-V PLL circuit power terminal. A parallel combination of high frequency decoupling capacitors near the terminal is suggested, such as 0.1 μ F and 0.001 μ F. Lower frequency 10- μ F filtering capacitors are also recommended. This supply terminal is separated from AVDD internal to the controller to provide noise isolation. It must be tied to a low-impedance point on the circuit board. When the internal voltage regulator is disabled ($VR_EN = 3.3$ V), no voltage is required to be supplied to this terminal.	PWR		0.1- μ F, 0.001- μ F, and 10- μ F capacitors tied to VSPLL	NA
VR_EN	H02	Internal voltage regulator enable. Active low	FT	FT	Pulled directly to GND	NA
VR_PORT	H01, M19	1.5-V output from the internal voltage regulator	PWR		0.1- μ F capacitor tied to GND	NA
VSSPLL	P14, T17	PLL circuit ground terminal. This terminal must be tied to the low-impedance circuit board ground plane.	GND			NA

Table 2–5. PC Card Power Switch Terminals

Internal pullup/pulldown resistors, power rail designation, and pin strapping are not applicable for the power switch terminals.

TERMINAL		DESCRIPTION	I/O TYPE	INPUT	OUTPUT	EXTERNAL COMPONENTS
NAME	NO.					
CLOCK	L06	Power switch clock. Information on the DATA line is sampled at the rising edge of CLOCK. CLOCK defaults to an input, but can be changed to an output by using bit 27 (P2CCLK) in the system control register (offset 80h, see Section 4.29).	I/O	TTL1	TTLO1	PCMCIA power switch
DATA	N01	Power switch data. DATA is used to communicate socket power control information serially to the power switch.	O		LVCO1	PCMCIA power switch
LATCH	N02	Power switch latch. LATCH is asserted by the controller to indicate to the power switch that the data on the DATA line is valid.	O		LVCO1	PCMCIA power switch

Table 2–6. PCI System Terminals

Internal pullup/pulldown resistors and pin strapping are not applicable for the PCI terminals.

TERMINAL		DESCRIPTION	I/O TYPE	INPUT	POWER RAIL	EXTERNAL COMPONENTS
NAME	NO.					
$\overline{\text{GRST}}$	T01	Global reset. When the global reset is asserted, the $\overline{\text{GRST}}$ signal causes the controller to place all output buffers in a high-impedance state and reset all internal registers. When $\overline{\text{GRST}}$ is asserted, the controller is completely in its default state. For systems that require wake-up from D3, $\overline{\text{GRST}}$ is normally asserted only during initial boot. $\overline{\text{PRST}}$ must be asserted following initial boot so that PME context is retained when transitioning from D3 to D0. For systems that do not require wake-up from D3, $\overline{\text{GRST}}$ must be tied to $\overline{\text{PRST}}$. When the $\overline{\text{SUSPEND}}$ mode is enabled, the controller is protected from the $\overline{\text{GRST}}$, and the internal registers are preserved. All outputs are placed in a high-impedance state, but the contents of the registers are preserved.	I	LVC12		Power-on reset or tied to $\overline{\text{PRST}}$
PCLK	P05	PCI bus clock. PCLK provides timing for all transactions on the PCI bus. All PCI signals are sampled at the rising edge of PCLK.	I	PCI3	VCCP	
$\overline{\text{PRST}}$	R03	PCI bus reset. When the PCI bus reset is asserted, $\overline{\text{PRST}}$ causes the controller to place all output buffers in a high-impedance state and reset some internal registers. When $\overline{\text{PRST}}$ is asserted, the controller is completely nonfunctional. After $\overline{\text{PRST}}$ is deasserted, the controller is in a default state. When $\overline{\text{SUSPEND}}$ and $\overline{\text{PRST}}$ are asserted, the controller is protected from $\overline{\text{PRST}}$ clearing the internal registers. All outputs are placed in a high-impedance state, but the contents of the registers are preserved.	I	PCI3	VCCP	

Table 2–7. PCI Address and Data Terminals

Internal pullup/pulldown resistors and pin strapping are not applicable for the PCI address and data terminals.

TERMINAL		DESCRIPTION	I/O TYPE	INPUT	OUTPUT	POWER RAIL
NAME	NO.					
AD31	U02	PCI address/data bus. These signals make up the multiplexed PCI address and data bus on the primary interface. During the address phase of a primary-bus PCI cycle, AD31–AD0 contain a 32-bit address or other destination information. During the data phase, AD31–AD0 contain data.	I/O	PCI13	PCIO3	VCCP
AD30	V01					
AD29	V02					
AD28	U03					
AD27	W02					
AD26	V03					
AD25	U04					
AD24	V04					
AD23	V05					
AD22	U05					
AD21	R06					
AD20	P06					
AD19	W06					
AD18	V06					
AD17	U06					
AD16	R07					
AD15	V09					
AD14	U09					
AD13	R09					
AD12	N09					
AD11	V10					
AD10	U10					
AD9	R10					
AD8	N10					
AD7	V11					
AD6	U11					
AD5	R11					
AD4	W12					
AD3	V12					
AD2	U12					
AD1	N11					
AD0	W13					
$\overline{C/BE3}$	W04	PCI-bus commands and byte enables. These signals are multiplexed on the same PCI terminals. During the address phase of a primary-bus PCI cycle, $\overline{C/BE3}$ – $\overline{C/BE0}$ define the bus command. During the data phase, this 4-bit bus is used as byte enables. The byte enables determine which byte paths of the full 32-bit data bus carry meaningful data. $\overline{C/BE0}$ applies to byte 0 (AD7–AD0), $\overline{C/BE1}$ applies to byte 1 (AD15–AD8), $\overline{C/BE2}$ applies to byte 2 (AD23–AD16), and $\overline{C/BE3}$ applies to byte 3 (AD31–AD24).	I/O	PCI13	PCIO3	VCCP
$\overline{C/BE2}$	W07					
$\overline{C/BE1}$	W09					
$\overline{C/BE0}$	W11					
PAR	P09	PCI-bus parity. In all PCI-bus read and write cycles, the controller calculates even parity across the AD31–AD0 and $\overline{C/BE3}$ – $\overline{C/BE0}$ buses. As an initiator during PCI cycles, the controller outputs this parity indicator with a one-PCLK delay. As a target during PCI cycles, the controller compares its calculated parity to the parity indicator of the initiator. A compare error results in the assertion of a parity error (\overline{PERR}).	I/O	PCI13	PCIO3	VCCP

Table 2–8. PCI Interface Control Terminals

Internal pullup/pulldown resistors and pin strapping are not applicable for the PCI interface control terminals.

TERMINAL		DESCRIPTION	I/O TYPE	INPUT	OUTPUT	POWER RAIL	EXTERNAL COMPONENTS
NAME	NO.						
$\overline{\text{DEVSEL}}$	N08	PCI device select. The controller asserts $\overline{\text{DEVSEL}}$ to claim a PCI cycle as the target device. As a PCI initiator on the bus, the controller monitors $\overline{\text{DEVSEL}}$ until a target responds. If no target responds before timeout occurs, then the controller terminates the cycle with an initiator abort.	I/O	PCII3	PCIO3	V _{CCP}	Pullup resistor per PCI specification
$\overline{\text{FRAME}}$	V07	PCI cycle frame. $\overline{\text{FRAME}}$ is driven by the initiator of a bus cycle. $\overline{\text{FRAME}}$ is asserted to indicate that a bus transaction is beginning, and data transfers continue while this signal is asserted. When $\overline{\text{FRAME}}$ is deasserted, the PCI bus transaction is in the final data phase.	I/O	PCII3	PCIO3	V _{CCP}	Pullup resistor per PCI specification
$\overline{\text{GNT}}$	T02	PCI bus grant. $\overline{\text{GNT}}$ is driven by the PCI bus arbiter to grant the controller access to the PCI bus after the current data transaction has completed. $\overline{\text{GNT}}$ may or may not follow a PCI bus request, depending on the PCI bus parking algorithm.	I	PCII3		V _{CCP}	
IDSEL	W05	Initialization device select. IDSEL selects the controller during configuration space accesses. IDSEL can be connected to one of the upper 24 PCI address lines on the PCI bus.	I	PCII3		V _{CCP}	
$\overline{\text{IRDY}}$	U07	PCI initiator ready. $\overline{\text{IRDY}}$ indicates the ability of the PCI bus initiator to complete the current data phase of the transaction. A data phase is completed on a rising edge of PCLK where both $\overline{\text{IRDY}}$ and TRDY are asserted. Until IRDY and TRDY are both sampled asserted, wait states are inserted.	I/O	PCII3	PCIO3	V _{CCP}	Pullup resistor per PCI specification
$\overline{\text{PERR}}$	V08	PCI parity error indicator. $\overline{\text{PERR}}$ is driven by a PCI controller to indicate that calculated parity does not match PAR when PERR is enabled through bit 6 of the command register (PCI offset 04h, see Section 4.4).	I/O	PCII3	PCIO3	V _{CCP}	Pullup resistor per PCI specification
$\overline{\text{REQ}}$	U01	PCI bus request. $\overline{\text{REQ}}$ is asserted by the controller to request access to the PCI bus as an initiator.	O		PCIO3	V _{CCP}	
$\overline{\text{SERR}}$	U08	PCI system error. $\overline{\text{SERR}}$ is an output that is pulsed from the controller when enabled through bit 8 of the command register (PCI offset 04h, see Section 4.4) indicating a system error has occurred. The controller need not be the target of the PCI cycle to assert this signal. When $\overline{\text{SERR}}$ is enabled in the command register, this signal also pulses, indicating that an address parity error has occurred on a CardBus interface.	O		PCIO3	V _{CCP}	Pullup resistor per PCI specification
$\overline{\text{STOP}}$	W08	PCI cycle stop signal. $\overline{\text{STOP}}$ is driven by a PCI target to request the initiator to stop the current PCI bus transaction. $\overline{\text{STOP}}$ is used for target disconnects and is commonly asserted by target devices that do not support burst data transfers.	I/O	PCII3	PCIO3	V _{CCP}	Pullup resistor per PCI specification
$\overline{\text{TRDY}}$	R08	PCI target ready. $\overline{\text{TRDY}}$ indicates the ability of the primary bus target to complete the current data phase of the transaction. A data phase is completed on a rising edge of PCLK when both $\overline{\text{IRDY}}$ and TRDY are asserted. Until both $\overline{\text{IRDY}}$ and TRDY are asserted, wait states are inserted.	I/O	PCII3	PCIO3	V _{CCP}	Pullup resistor per PCI specification

Table 2–9. Multifunction and Miscellaneous Terminals

The power rail designation is not applicable for the multifunction and miscellaneous terminals.

TERMINAL		DESCRIPTION	I/O TYPE	INPUT	OUTPUT	PU/PD	EXTERNAL COMPONENTS	PIN STRAPPING (IF UNUSED)
NAME	NO.							
<u>A_USB_EN</u> <u>B_USB_EN</u>	E02 E01	USB enable. These output terminals control an external CBT switch for each socket when an USB card is inserted into the socket.	O		LVCO1		CBT switch	Float
CLK_48	M01	A 48-MHz clock must be connected to this terminal.	I	LVC11			48 MHz clock source	
MFUNC0	N03	Multifunction terminals 0–6. See Section 4.36, <i>Multifunction Routing Status Register</i> , for configuration details.	I/O	PCII3	PCIO3			10-kΩ to 47-kΩ pullup resistor
MFUNC1	M05		I/O	PCII3	PCIO3			10-kΩ to 47-kΩ pullup resistor
MFUNC2	P01		I/O	PCII3	PCIO3			10-kΩ to 47-kΩ pullup resistor
MFUNC3	P02		I/O	PCII3	PCIO3			10-kΩ to 47-kΩ pullup resistor
MFUNC4	P03		I/O	PCII3	PCIO3			10-kΩ to 47-kΩ pullup resistor
MFUNC5	N05		I/O	PCII3	PCIO3			10-kΩ to 47-kΩ pullup resistor
MFUNC6	R01		I/O	PCII3	PCIO3			10-kΩ to 47-kΩ pullup resistor
NC	W17	Reserved. This terminal has no connection anywhere within the package.						Float
PHY_TEST_MA	R17	PHY test pin. Not for customer use. It must be pulled high with a 4.7-kΩ resistor.	I	LVC11		PD1		NA
<u>RI_OUT/</u> <u>PME</u>	T03	Ring indicate out and power management event output. This terminal provides an output for ring-indicate or PME signals.	O		LVCO2		Pullup resistor per PCI specification	NA
RSVD	T19	Reserved. This terminal has no connection anywhere within the package.	—					Float
SCL	M03	Serial clock. At <u>PRST</u> , the SCL signal is sampled to determine if a two-wire serial ROM is present. If the serial ROM is detected, then this terminal provides the serial clock signaling and is implemented as open-drain. For normal operation (a ROM is implemented in the design), this terminal must be pulled high to the ROM V_{DD} with a 2.7-kΩ resistor. Otherwise, it must be pulled low to ground with a 220-Ω resistor.	I/O	TTL11	TTLO1		Pullup resistor per I ² C specification (value depends on EEPROM, typically 2.7 kΩ)	Tie to GND if not using EEPROM
SDA	M02	Serial data. This terminal is implemented as open-drain, and for normal operation (a ROM is implemented in the design), this terminal must be pulled high to the ROM V_{DD} with a 2.7-kΩ resistor. Otherwise, it must be pulled low to ground with a 220-Ω resistor.	I/O	TTL11	TTLO1		Pullup resistor per I ² C specification (value depends on EEPROM, typically 2.7 kΩ)	Tie to GND if not using EEPROM
SPKROUT	L07	Speaker output. SPKROUT is the output to the host system that can carry SPKR or CAUDIO through the controller from the PC Card interface. SPKROUT is driven as the exclusive-OR combination of card <u>SPKR</u> / <u>CAUDIO</u> inputs.	O		TTLO1		10-kΩ to 47-kΩ pulldown resistor	10-kΩ to 47-kΩ pulldown resistor
<u>SUSPEND</u>	R02	Suspend. <u>SUSPEND</u> protects the internal registers from clearing when the <u>GRST</u> or <u>PRST</u> signal is asserted. See Section 3.8.5, <i>Suspend Mode</i> , for details.	I	PCII6			10-kΩ to 47-kΩ pullup resistor	10-kΩ to 47-kΩ pullup resistor
TEST0	P12	Terminal TEST0 is used for factory test of the controller and must be connected to ground for normal operation.	I/O	LVC11		PD1		Tie to GND

Table 2–10. 16-Bit PC Card Address and Data Terminals

External components are not applicable for the 16-bit PC Card address and data terminals. If any 16-bit PC Card address and data terminal is unused, then the terminal may be left floating.

Table 2–11. 16-Bit PC Card Interface Control Terminals

External components are not applicable for the 16-bit PC Card interface control terminals. If any 16-bit PC Card interface control terminal is unused, then the terminal may be left floating.

SKT A TERMINAL		SKT B TERMINAL†		DESCRIPTION	I/O TYPE	POWER RAIL
NAME	NO.	NAME	NO.			
$\overline{A_BVD1}$ (STSCHG/RI)	B02	$\overline{B_BVD1}$ (STSCHG/RI)	F14	Battery voltage detect 1. BVD1 is generated by 16-bit memory PC Cards that include batteries. BVD1 is used with BVD2 as an indication of the condition of the batteries on a memory PC Card. Both BVD1 and BVD2 are high when the battery is good. When BVD2 is low and BVD1 is high, the battery is weak and must be replaced. When BVD1 is low, the battery is no longer serviceable and the data in the memory PC Card is lost. See Section 5.6, <i>ExCA Card Status-Change Interrupt Configuration Register</i> , for enable bits. See Section 5.5, <i>ExCA Card Status-Change Register</i> , and Section 5.2, <i>ExCA Interface Status Register</i> , for the status bits for this signal. Status change. \overline{STSCHG} alerts the system to a change in the READY, write protect, or battery voltage dead condition of a 16-bit I/O PC Card. Ring indicate. \overline{RI} is used by 16-bit modem cards to indicate a ring detection.	I	VCCA/ VCCB
$\overline{A_BVD2}$ (SPKR)	A02	$\overline{B_BVD2}$ (SPKR)	C17	Battery voltage detect 2. BVD2 is generated by 16-bit memory PC Cards that include batteries. BVD2 is used with BVD1 as an indication of the condition of the batteries on a memory PC Card. Both BVD1 and BVD2 are high when the battery is good. When BVD2 is low and BVD1 is high, the battery is weak and must be replaced. When BVD1 is low, the battery is no longer serviceable and the data in the memory PC Card is lost. See Section 5.6, <i>ExCA Card Status-Change Interrupt Configuration Register</i> , for enable bits. See Section 5.5, <i>ExCA Card Status-Change Register</i> , and Section 5.2, <i>ExCA Interface Status Register</i> , for the status bits for this signal. Speaker. SPKR is an optional binary audio signal available only when the card and socket have been configured for the 16-bit I/O interface. The audio signals from cards A and B are combined by the controller and are output on SPKROUT. DMA request. BVD2 can be used as the DMA request signal during DMA operations to a 16-bit PC Card that supports DMA. The PC Card asserts BVD2 to indicate a request for a DMA operation.	I	VCCA/ VCCB
$\overline{A_CD1}$ $\overline{A_CD2}$	C15 E05	$\overline{B_CD1}$ $\overline{B_CD2}$	N13 B17	Card detect 1 and card detect 2. CD1 and CD2 are internally connected to ground on the PC Card. When a PC Card is inserted into a socket, CD1 and CD2 are pulled low. For signal status, see Section 5.2, <i>ExCA Interface Status Register</i> .	I	
$\overline{A_CE1}$ $\overline{A_CE2}$	G12 B12	$\overline{B_CE1}$ $\overline{B_CE2}$	M18 L19	Card enable 1 and card enable 2. $\overline{CE1}$ and $\overline{CE2}$ enable even- and odd-numbered address bytes. $\overline{CE1}$ enables even-numbered address bytes, and $\overline{CE2}$ enables odd-numbered address bytes.	O	VCCA/ VCCB
$\overline{A_INPACK}$	E07	$\overline{B_INPACK}$	E18	Input acknowledge. \overline{INPACK} is asserted by the PC Card when it can respond to an I/O read cycle at the current address. DMA request. \overline{INPACK} can be used as the DMA request signal during DMA operations from a 16-bit PC Card that supports DMA. If it is used as a strobe, then the PC Card asserts this signal to indicate a request for a DMA operation.	I	VCCA/ VCCB
$\overline{A_IORD}$	C11	$\overline{B_IORD}$	L15	I/O read. \overline{IORD} is asserted by the controller to enable 16-bit I/O PC Card data output during host I/O read cycles. DMA write. \overline{IORD} is used as the DMA write strobe during DMA operations from a 16-bit PC Card that supports DMA. The controller asserts \overline{IORD} during DMA transfers from the PC Card to host memory.	O	VCCA/ VCCB
$\overline{A_IOWR}$	E11	$\overline{B_IOWR}$	L13	I/O write. \overline{IOWR} is driven low by the controller to strobe write data into 16-bit I/O PC Cards during host I/O write cycles. DMA read. \overline{IOWR} is used as the DMA write strobe during DMA operations from a 16-bit PC Card that supports DMA. The controller asserts \overline{IOWR} during transfers from host memory to the PC Card.	O	VCCA/ VCCB

† These terminals are reserved for the PCI6611 and PCI6411 controllers.

Table 2–11. 16-Bit PC Card Interface Control Terminals (Continued)

SKT A TERMINAL		SKT B TERMINAL†		DESCRIPTION	I/O TYPE	POWER RAIL
NAME	NO.	NAME	NO.			
$\overline{A_OE}$	C12	$\overline{B_OE}$	L18	Output enable. \overline{OE} is driven low by the controller to enable 16-bit memory PC Card data output during host memory read cycles. DMA terminal count. \overline{OE} is used as terminal count (TC) during DMA operations to a 16-bit PC Card that supports DMA. The controller asserts \overline{OE} to indicate TC for a DMA write operation.	O	VCCA/ VCCB
A_READY (IREQ)	C04	B_READY (IREQ)	B19	Ready. The ready function is provided when the 16-bit PC Card and the host socket are configured for the memory-only interface. READY is driven low by 16-bit memory PC Cards to indicate that the memory card circuits are busy processing a previous write command. READY is driven high when the 16-bit memory PC Card is ready to accept a new data transfer command. Interrupt request. \overline{IREQ} is asserted by a 16-bit I/O PC Card to indicate to the host that a controller on the 16-bit I/O PC Card requires service by the host software. \overline{IREQ} is high (deasserted) when no interrupt is requested.	I	VCCA/ VCCB
$\overline{A_REG}$	C05	$\overline{B_REG}$	F15	Attribute memory select. \overline{REG} remains high for all common memory accesses. When \overline{REG} is asserted, access is limited to attribute memory (\overline{OE} or \overline{WE} active) and to the I/O space (\overline{IORD} or \overline{IOWR} active). Attribute memory is a separately accessed section of card memory and is generally used to record card capacity and other configuration and attribute information. DMA acknowledge. \overline{REG} is used as a DMA acknowledge (DACK) during DMA operations to a 16-bit PC Card that supports DMA. The controller asserts \overline{REG} to indicate a DMA operation. \overline{REG} is used in conjunction with the DMA read (\overline{IOWR}) or DMA write (\overline{IORD}) strobes to transfer data.	O	VCCA/ VCCB
A_RESET	A06	B_RESET	F17	PC Card reset. RESET forces a hard reset to a 16-bit PC Card.	O	VCCA/ VCCB
$\overline{A_VS1}$ $\overline{A_VS2}$	A03 E08	$\overline{B_VS1}$ $\overline{B_VS2}$	C18 F19	Voltage sense 1 and voltage sense 2. $\overline{VS1}$ and $\overline{VS2}$, when used in conjunction with each other, determine the operating voltage of the PC Card.	I/O	VCCA/ VCCB
$\overline{A_WAIT}$	B03	$\overline{B_WAIT}$	B18	Bus cycle wait. \overline{WAIT} is driven by a 16-bit PC Card to extend the completion of the memory or I/O cycle in progress.	I	VCCA/ VCCB
$\overline{A_WE}$	B09	$\overline{B_WE}$	J15	Write enable. \overline{WE} is used to strobe memory write data into 16-bit memory PC Cards. \overline{WE} is also used for memory PC Cards that employ programmable memory technologies. DMA terminal count. \overline{WE} is used as a TC during DMA operations to a 16-bit PC Card that supports DMA. The controller asserts \overline{WE} to indicate the TC for a DMA read operation.	O	VCCA/ VCCB
A_WP (IOIS16)	C03	B_WP (IOIS16)	A18	Write protect. WP applies to 16-bit memory PC Cards. WP reflects the status of the write-protect switch on 16-bit memory PC Cards. For 16-bit I/O cards, WP is used for the 16-bit port ($\overline{IOIS16}$) function. I/O is 16 bits. $\overline{IOIS16}$ applies to 16-bit I/O PC Cards. $\overline{IOIS16}$ is asserted by the 16-bit PC Card when the address on the bus corresponds to an address to which the 16-bit PC Card responds, and the I/O port that is addressed is capable of 16-bit accesses. DMA request. WP can be used as the DMA request signal during DMA operations to a 16-bit PC Card that supports DMA. If used, then the PC Card asserts WP to indicate a request for a DMA operation.	I	VCCA/ VCCB

† These terminals are reserved for the PCI6611 and PCI6411 controllers.

Table 2–12. CardBus PC Card Interface System Terminals

A 33-Ω to 47-Ω series damping resistor (per PC Card specification) is the only external component needed for terminals B08 (A_CCLK) and H17 (B_CCLK). If any CardBus PC Card interface system terminal is unused, then the terminal may be left floating.

SKT A TERMINAL		SKT B TERMINAL†		DESCRIPTION	I/O TYPE	INPUT	OUTPUT	PU/ PD	POWER RAIL
NAME	NO.	NAME	NO.						
A_CCLK	E09	B_CCLK	H18	CardBus clock. CCLK provides synchronous timing for all transactions on the CardBus interface. All signals except $\overline{\text{CRST}}$, $\overline{\text{CCLKRUN}}$, $\overline{\text{CINT}}$, $\overline{\text{CSTSCHG}}$, $\overline{\text{CAUDIO}}$, $\overline{\text{CCD2}}$, $\overline{\text{CCD1}}$, $\overline{\text{CVS2}}$, and $\overline{\text{CVS1}}$ are sampled on the rising edge of CCLK, and all timing parameters are defined with the rising edge of this signal. CCLK operates at the PCI bus clock frequency, but it can be stopped in the low state or slowed down for power savings.	O		PCIO3		VCCA/ VCCB
$\overline{\text{A_CCLKRUN}}$	C03	$\overline{\text{B_CCLKRUN}}$	A18	CardBus clock run. $\overline{\text{CCLKRUN}}$ is used by a CardBus PC Card to request an increase in the CCLK frequency, and by the controller to indicate that the CCLK frequency is going to be decreased.	I/O	PCI4	PCIO4	PU3	VCCA/ VCCB
$\overline{\text{A_CRST}}$	A06	$\overline{\text{B_CRST}}$	F17	CardBus reset. $\overline{\text{CRST}}$ brings CardBus PC Card-specific registers, sequencers, and signals to a known state. When $\overline{\text{CRST}}$ is asserted, all CardBus PC Card signals are placed in a high-impedance state, and the controller drives these signals to a valid logic level. Assertion can be asynchronous to CCLK, but deassertion must be synchronous to CCLK.	O	PCI4	PCIO4	PU3	VCCA/ VCCB

† These terminals are reserved for the PCI6611 and PCI6411 controllers.

Table 2–13. CardBus PC Card Address and Data Terminals

External components are not applicable for the 16-bit PC Card address and data terminals. If any CardBus PC Card address and data terminal is unused, then the terminal may be left floating.

SKT A TERMINAL		SKT B TERMINAL†		DESCRIPTION	I/O TYPE	INPUT	OUTPUT	POWER RAIL
NAME	NO.	NAME	NO.					
A_CAD31	D01	B_CAD31	B15	CardBus address and data. These signals make up the multiplexed CardBus address and data bus on the CardBus interface. During the address phase of a CardBus cycle, CAD31–CAD0 contain a 32-bit address. During the data phase of a CardBus cycle, CAD31–CAD0 contain data. CAD31 is the most significant bit. A_CC/BE0	G12	B_CC/BE0	M18					
A_CPAR	G10	B_CPAR	K13	CardBus parity. In all CardBus read and write cycles, the controller calculates even parity across the CAD and CC/BE buses. As an initiator during CardBus cycles, the controller outputs CPAR with a one-CCLK delay. As a target during CardBus cycles, the controller compares its calculated parity to the parity indicator of the initiator; a compare error results in a parity error assertion.	I/O	PCII7	PCIO7	VCCA/ VCCB

† These terminals are reserved for the PCI6611 and PCI6411 controllers.

Table 2–14. CardBus PC Card Interface Control Terminals

If any CardBus PC Card interface control terminal is unused, then the terminal may be left floating.

SKT A TERMINAL		SKT B TERMINAL†		DESCRIPTION	I/O TYPE	INPUT	OUTPUT	PU/PD	POWER RAIL
NAME	NO.	NAME	NO.						
A_AUDIO	A02	B_AUDIO	C17	CardBus audio. CAUDIO is a digital input signal from a PC Card to the system speaker. The controller supports the binary audio mode and outputs a binary signal from the card to SPKROUT.	I	PCI14	PCIO4	PU3	VCCA/ VCCB
A_CBLOCK	E10	B_CBLOCK	J19	CardBus lock. CBLOCK is used to gain exclusive access to a target.	I/O	PCI14	PCIO4	PU3	VCCA/ VCCB
A_CCD1 A_CCD2	C15 E05	B_CCD1 B_CCD2	N13 B17	CardBus detect 1 and CardBus detect 2. CCD1 and CCD2 are used in conjunction with CVS1 and CVS2 to identify card insertion and interrogate cards to determine the operating voltage and card type.	I	TTL12		PU4	
A_CDEVSEL	C09	B_CDEVSEL	H19	CardBus device select. The controller asserts CDEVSEL to claim a CardBus cycle as the target device. As a CardBus initiator on the bus, the controller monitors CDEVSEL until a target responds. If no target responds before timeout occurs, then the controller terminates the cycle with an initiator abort.	I/O	PCI14	PCIO4	PU3	VCCA/ VCCB
A_CFRAME	C08	B_CFRAME	G19	CardBus cycle frame. CFRAME is driven by the initiator of a CardBus bus cycle. CFRAME is asserted to indicate that a bus transaction is beginning, and data transfers continue while this signal is asserted. When CFRAME is deasserted, the CardBus bus transaction is in the final data phase.	I/O	PCI17	PCIO7		VCCA/ VCCB
A_CGNT	B09	B_CGNT	J15	CardBus bus grant. CGNT is driven by the controller to grant a CardBus PC Card access to the CardBus bus after the current data transaction has been completed.	O	PCI17	PCIO7		VCCA/ VCCB
A_CINT	C04	B_CINT	B19	CardBus interrupt. CINT is asserted low by a CardBus PC Card to request interrupt servicing from the host.	I	PCI14	PCIO4	PU3	VCCA/ VCCB
A_CIRDY	B08	B_CIRDY	J13	CardBus initiator ready. CIRDY indicates the ability of the CardBus initiator to complete the current data phase of the transaction. A data phase is completed on a rising edge of CCLK when both CIRDY and CTRDY are asserted. Until CIRDY and CTRDY are both sampled asserted, wait states are inserted.	I/O	PCI14	PCIO4	PU3	VCCA/ VCCB
A_CPERR	F10	B_CPERR	J18	CardBus parity error. CPERR reports parity errors during CardBus transactions, except during special cycles. It is driven low by a target two clocks following the data cycle during which a parity error is detected.	I/O	PCI14	PCIO4	PU3	VCCA/ VCCB
A_CREQ	E07	B_CREQ	E18	CardBus request. CREQ indicates to the arbiter that the CardBus PC Card desires use of the CardBus bus as an initiator.	I	PCI14	PCIO4	PU3	VCCA/ VCCB
A_CSERR	B03	B_CSERR	B18	CardBus system error. CSERR reports address parity errors and other system errors that could lead to catastrophic results. CSERR is driven by the card synchronous to CCLK, but deasserted by a weak pullup; deassertion may take several CCLK periods. The controller can report CSERR to the system by assertion of SERR on the PCI interface.	I	PCI14	PCIO4	PU3	VCCA/ VCCB

† These terminals are reserved for the PCI6611 and PCI6411 controllers.

SC_RFU	K01	Smart Card reserved. This terminal is in a high-impedance state.	I	PCI5	PCIO5	SW3	5 V	
SC_RST	K03	Smart Card This signal starts and stops the Smart Card reset sequence. The controller asserts this reset when requested by the host.	O		PCIO6			
SC_VCC_5V	K07	Smart Card power terminal	PWR					1 kΩ resistor to 5 V

† These terminals are reserved for the PCI6421 and PCI6411 controllers.

3 Feature/Protocol Descriptions

The following sections give an overview of the PCI6x21/PCI6x11 controller. Figure 3–1 shows the connections to the PCI6x21/PCI6x11 controller. The PCI interface includes all address/data and control signals for PCI protocol. The interrupt interface includes terminals for parallel PCI, parallel ISA, and serialized PCI and ISA signaling.

Figure 3–1. PCI6x21/PCI6x11 System Block Diagram

3.1 Power Supply Sequencing

The PCI6x21/PCI6x11 controller contains 3.3-V I/O buffers with 5-V tolerance requiring a core power supply and clamp voltages. The core power supply is always 1.5 V. The clamp voltages can be either 3.3 V or 5 V, depending on the interface. The following power-up and power-down sequences are recommended.

The power-up sequence is:

1. Power core 1.5 V.
2. Apply the I/O voltage.
3. Apply the analog voltage.
4. Apply the clamp voltage.

The power-down sequence is:

1. Remove the clamp voltage.
2. Remove the analog voltage.
3. Remove the I/O voltage.
4. Remove power from the core.

NOTE: If the voltage regulator is enabled, then steps 2, 3, and 4 of the power-up sequence and steps 1, 2, and 3 of the power-down sequence all occur simultaneously.

3.2 I/O Characteristics

The PCI6x21/PCI6x11 controller meets the ac specifications of the *PC Card Standard* (release 8.1) and the *PCI Local Bus Specification*. Figure 3–2 shows a 3-state bidirectional buffer. Section 10.2, *Recommended Operating Conditions*, provides the electrical characteristics of the inputs and outputs.

Figure 3–2. 3-State Bidirectional Buffer

3.3 Clamping Voltages

The clamping voltages are set to match whatever external environment the PCI6x21/PCI6x11 controller is interfaced with: 3.3 V or 5 V. The I/O sites can be pulled through a clamping diode to a voltage rail that protects the core from external signals. The core power supply is 1.5 V and is independent of the clamping voltages. For example, PCI signaling can be either 3.3 V or 5 V, and the PCI6x21/PCI6x11 controller must reliably accommodate both voltage levels. This is accomplished by using a 3.3-V I/O buffer that is 5-V tolerant, with the applicable clamping voltage applied. If a system designer desires a 5-V PCI bus, then V_{CCP} can be connected to a 5-V power supply.

3.4 Peripheral Component Interconnect (PCI) Interface

The PCI6x21/PCI6x11 controller is fully compliant with the *PCI Local Bus Specification*. The PCI6x21/PCI6x11 controller provides all required signals for PCI master or slave operation, and may operate in either a 5-V or 3.3-V signaling environment by connecting the V_{CCP} terminals to the desired voltage level. In addition to the mandatory PCI signals, the PCI6x21/PCI6x11 controller provides the optional interrupt signals \overline{INTA} , \overline{INTB} , \overline{INTC} , and \overline{INTD} .

3.4.1 Device Resets

During the power-up sequence, \overline{GRST} and \overline{PRST} must be asserted. \overline{GRST} can only be deasserted 100 μ s after PCLK is stable, and 2 ms after V_{CC} is stable. \overline{PRST} can be deasserted at the same time as \overline{GRST} or any time thereafter.

3.4.2 Serial EEPROM I²C Bus

The PCI6x21/PCI6x11 controller offers many choices for modes of operation, and these choices are selected by programming several configuration registers. For system board applications, these registers are normally programmed through the BIOS routine. For add-in card and docking-station/port-replicator applications, the PCI6x21/PCI6x11 controller provides a two-wire inter-integrated circuit (IIC or I²C) serial bus for use with an external serial EEPROM.

The PCI6x21/PCI6x11 controller is always the bus master, and the EEPROM is always the slave. Either device can drive the bus low, but neither device drives the bus high. The high level is achieved through the use of pullup resistors on the SCL and SDA signal lines. The PCI6x21/PCI6x11 controller is always the source of the clock signal, SCL.

System designers who wish to load register values with a serial EEPROM must use pullup resistors on the SCL and SDA terminals. If the PCI6x21/PCI6x11 controller detects a logic-high level on the SCL terminal at the end of \overline{GRST} , then it initiates incremental reads from the external EEPROM. Any size serial EEPROM up to the I²C limit of 16 Kbits can be used, but only the first 96 bytes (from offset 00h to offset 5Fh) are required to configure the PCI6x21/PCI6x11 controller. Figure 3–3 shows a serial EEPROM application.

In addition to loading configuration data from an EEPROM, the PCI6x21/PCI6x11 I²C bus can be used to read and write from other I²C serial devices. A system designer can control the I²C bus, using the PCI6x21/PCI6x11 controller

as bus master, by reading and writing PCI configuration registers. Setting bit 3 (SBDETECT) in the serial bus control/status register (PCI offset B3h, see Section 4.50) causes the PCI6x21/PCI6x11 controller to route the SDA and SCL signals to the SDA and SCL terminals, respectively. The read/write data, slave address, and byte addresses are manipulated by accessing the serial bus data, serial bus index, and serial bus slave address registers (PCI offsets B0h, B1h, and B2h; see Sections 4.47, 4.48, and 4.49, respectively).

EEPROM interface status information is communicated through the serial bus control and status register (PCI offset B3h, see Section 4.50). Bit 3 (SBDETECT) in this register indicates whether or not the PCI6x21/PCI6x11 serial ROM circuitry detects the pullup resistor on SCL. Any undefined condition, such as a missing acknowledge, results in bit 0 (ROM_ERR) being set. Bit 4 (ROMBUSY) is set while the subsystem ID register is loading (serial ROM interface is busy).

The subsystem vendor ID for functions 2 and 3 is also loaded through EEPROM. The EEPROM load data goes to all four functions from the serial EEPROM loader.

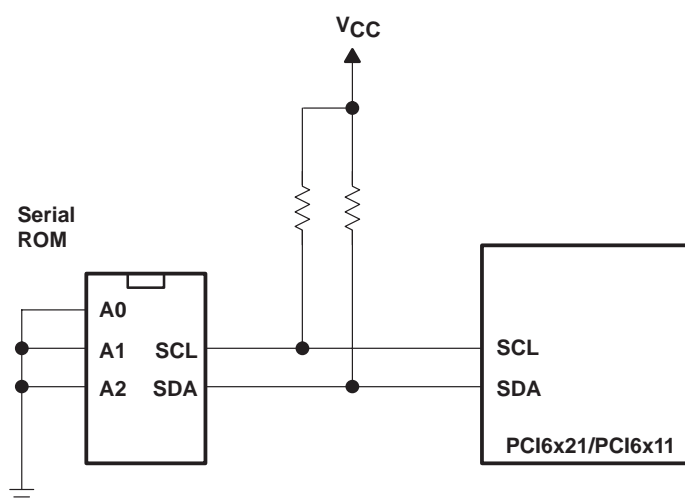

Figure 3–3. Serial ROM Application

3.4.3 Functions 0 and 1 (CardBus) Subsystem Identification

The subsystem vendor ID register (PCI offset 40h, see Section 4.26) and subsystem ID register (PCI offset 42h, see Section 4.27) make up a doubleword of PCI configuration space for functions 0 and 1. This doubleword register is used for system and option card (mobile dock) identification purposes and is required by some operating systems. Implementation of this unique identifier register is a *PC 99/PC 2001* requirement.

The PCI6x21/PCI6x11 controller offers two mechanisms to load a read-only value into the subsystem registers. The first mechanism relies upon the system BIOS providing the subsystem ID value. The default access mode to the subsystem registers is read-only, but can be made read/write by clearing bit 5 (SUBSYSRW) in the system control register (PCI offset 80h, see Section 4.29). Once this bit is cleared, the BIOS can write a subsystem identification value into the registers at PCI offset 40h. The BIOS must set the SUBSYSRW bit such that the subsystem vendor ID register and subsystem ID register are limited to read-only access. This approach saves the added cost of implementing the serial electrically erasable programmable ROM (EEPROM).

In some conditions, such as in a docking environment, the subsystem vendor ID register and subsystem ID register must be loaded with a unique identifier via a serial EEPROM. The PCI6x21/PCI6x11 controller loads the data from the serial EEPROM after a reset of the primary bus. Note that the $\overline{\text{SUSPEND}}$ input gates the PCI reset from the entire PCI6x21/PCI6x11 core, including the serial-bus state machine (see Section 3.8.5, *Suspend Mode*, for details on using $\overline{\text{SUSPEND}}$).

The PCI6x21/PCI6x11 controller provides a two-line serial-bus host controller that can interface to a serial EEPROM. See Section 3.6, *Serial EEPROM Interface*, for details on the two-wire serial-bus controller and applications.

3.4.4 Function 3 (Flash Media) Subsystem Identification

The subsystem identification register is used for system and option card identification purposes. This register can be initialized from the serial EEPROM or programmed via the subsystem access register at offset 50h in the PCI configuration space (see Section 7.22, *Subsystem Access Register*). See Table 7–15 for a complete description of the register contents.

The contents of the subsystem access register are aliased to the subsystem vendor ID and subsystem ID registers at Function 3 PCI offsets 2Ch and 2Eh, respectively. See Table 7–15 for a complete description of the register contents.

3.4.5 Function 4 SD Host Subsystem Identification

The subsystem identification register is used for system and option card identification purposes. This register can be initialized from the serial EEPROM or programmed via the subsystem access register at offset 8Ch in the PCI configuration space (see Section 8.23, *Subsystem Access Register*). See Table 8–16 for a complete description of the register contents.

The contents of the subsystem access register are aliased to the subsystem vendor ID and subsystem ID registers at Function 4 PCI offsets 2Ch and 2Eh, respectively. See Table 8–16 for a complete description of the register contents.

3.4.6 Function 5 Smart Card Subsystem Identification

The subsystem identification register is used for system and option card identification purposes. This register can be initialized from the serial EEPROM or programmed via the subsystem access register at offset 50h in the PCI configuration space (see Section 9.23, *Subsystem ID Alias Register*). See Table 9–14 for a complete description of the register contents.

The contents of the subsystem access register are aliased to the subsystem vendor ID and subsystem ID registers at Function 5 PCI offsets 2Ch and 2Eh, respectively. See Table 9–14 for a complete description of the register contents.

3.5 PC Card Applications

The PCI6x21/PCI6x11 controller supports all the PC Card features and applications as described below.

- Card insertion/removal and recognition per the *PC Card Standard* (release 8.1)
- Speaker and audio applications
- LED socket activity indicators
- PC Card controller programming model
- CardBus socket registers

3.5.1 PC Card Insertion/Removal and Recognition

The *PC Card Standard* (release 8.1) addresses the card-detection and recognition process through an interrogation procedure that the socket must initiate on card insertion into a cold, nonpowered socket. Through this interrogation, card voltage requirements and interface (16-bit versus CardBus) are determined.

The scheme uses the card-detect and voltage-sense signals. The configuration of these four terminals identifies the card type and voltage requirements of the PC Card interface.

3.5.2 Low Voltage CardBus Card Detection

The card detection logic of the PCI6x21/PCI6x11 controller includes the detection of Cardbus cards with $V_{CC} = 3.3\text{ V}$ and $V_{PP} = 1.8\text{ V}$. The reporting of the 1.8-V CardBus card ($V_{CC} = 3.3\text{ V}$, $V_{PP} = 1.8\text{ V}$) is reported through the socket present state register as follows based on bit 10 (12V_SW_SEL) in the general control register (PCI offset 86h, see Section 4.31):

- If the 12V_SW_SEL bit is 0 (TPS2228 is used), then the 1.8-V CardBus card causes the 3VCARD bit in the socket present state register to be set.
- If the 12V_SW_SEL bit is 1 (TPS2226 is used), then the 1.8-V CardBus card causes the XVCARD bit in the socket present state register to be set.

3.5.3 UltraMedia Card Detection

The PCI6x21/PCI6x11 controller is capable of detecting all the UltraMedia devices defined by the PCMCIA *Proposal 0262 – MultiMedia Cards*, Secure Digital, Memory Stick devices, and Smart Card devices. The detection of these devices is made possible through circuitry included in the PCI6x21/PCI6x11 controller and the adapters used to interface these devices with the PC Card/CardBus sockets. No additional hardware requirements are placed on the system designer in order to support these devices.

The *PC Card Standard* addresses the card detection and recognition process through an interrogation procedure that the socket must initiate upon card insertion into a cold, unpowered socket. Through this interrogation, card voltage requirements and interface type (16-bit vs. CardBus) are determined. The scheme uses the CD1, CD2, VS1, and VS2 signals (CCD1, CCD2, CVS1, CVS2 for CardBus). A PC Card designer connects these four terminals in a certain configuration to indicate the type of card and its supply voltage requirements. The encoding scheme for this, defined in the *PC Card Standard*, is shown in Table 3–1.

Table 3–1. PC Card—Card Detect and Voltage Sense Connections

$\overline{CD2}/\overline{CCD2}$	$\overline{CD1}/\overline{CCD1}$	$\overline{VS2}/\overline{CVS2}$	$\overline{VS1}/\overline{CVS1}$	Key	Interface	V_{CC}	V_{PP}/V_{CORE}

3.5.4 Flash Media Card Detection

The PCI6x21/PCI6x11 controller detects an MMC/SD card insertion through the $\overline{MC_CD_0}$ terminal. When this terminal is 0, an MMC/SD card is inserted in the socket. The PCI6x21/PCI6x11 controller debounces the $\overline{MC_CD_0}$ signal such that instability of the signal does not cause false card insertions. The debounce time is approximately 50 ms. The $\overline{MC_CD_0}$ signal is not debounced on card removals. The filtered $\overline{MC_CD_0}$ signal is used in the MMC/SD card detection and power control logic.

The MMC/SD card detection and power control logic contains three main states:

- Socket empty, power off
- Card inserted, power off
- Card inserted, power on

The PCI6x21/PCI6x11 controller detects a Memory Stick card insertion through the $\overline{MC_CD_1}$ terminal. When this terminal is 0, a Memory Stick card is inserted in the socket. The PCI6x21/PCI6x11 controller debounces the $\overline{MC_CD_1}$ signal such that instability of the signal does not cause false card insertions. The debounce time is approximately 50 ms. The $\overline{MC_CD_1}$ signal is not debounced on card removals. The filtered $\overline{MC_CD_1}$ signal is used in the Memory Stick card detection and power control logic.

The Memory Stick card detection and power control logic contains three main states:

- Socket empty, power off
- Card inserted, power off
- Card inserted, power on

3.5.5 Power Switch Interface

The power switch interface of the PCI6x21/PCI6x11 controller is a 3-pin serial interface. This 3-pin interface is implemented such that the PCI6x21/PCI6x11 controller can connect to both the TPS2226 and TPS2228 power switches. Bit 10 (12V_SW_SEL) in the general control register (PCI offset 86h, see Section 4.31) selects the power switch that is implemented. The PCI6x21/PCI6x11 controller defaults to use the control logic for the TPS2228 power switch. See Table 3–2 and Table 3–5 below for the power switch control logic.

Table 3–2. TPS2228 Control Logic—xVPP/VCORE

3.5.6 Internal Ring Oscillator

The internal ring oscillator provides an internal clock source for the PCI6x21/PCI6x11 controller so that neither the PCI clock nor an external clock is required in order for the PCI6x21/PCI6x11 controller to power down a socket or interrogate a PC Card. This internal oscillator, operating nominally at 16 kHz, is always enabled.

3.5.7 Integrated Pullup Resistors for PC Card Interface

The *PC Card Standard* requires pullup resistors on various terminals to support both CardBus and 16-bit PC Card configurations. The PCI6x21/PCI6x11 controller has integrated all of these pullup resistors and requires no additional external components. The I/O buffer on the BVD1(STSCHG)/CSTSCHG terminal has the capability to switch to an internal pullup resistor when a 16-bit PC Card is inserted, or switch to an internal pulldown resistor when a CardBus card is inserted. This prevents inadvertent CSTSCHG events. The pullup resistor requirements for the various UltraMedia interfaces are either included in the UltraMedia cards (or the UltraMedia adapter) or are part of the existing PCMCIA architecture. The PCI6x21/PCI6x11 controller does not require any additional components for UltraMedia support.

3.5.8 SPKROUT and CAUDPWM Usage

The SPKROUT terminal carries the digital audio signal from the PC Card to the system. When a 16-bit PC Card is configured for I/O mode, the BVD2 terminal becomes the $\overline{\text{SPKR}}$ input terminal from the card. This terminal, in CardBus applications, is referred to as CAUDIO. $\overline{\text{SPKR}}$ passes a TTL-level binary audio signal to the PCI6x21/PCI6x11 controller. The CardBus CAUDIO signal also can pass a single-amplitude binary waveform as well as a PWM signal. The binary audio signal from each PC Card sockets is enabled by bit 1 (SPKROUTEN) of the card control register (PCI offset 91h, see Section 4.38).

Older controllers support CAUDIO in binary or PWM mode, but use the same output terminal (SPKROUT). Some audio chips may not support both modes on one terminal and may have a separate terminal for binary and PWM. The PCI6x21/PCI6x11 implementation includes a signal for PWM, CAUDPWM, which can be routed to an MFUNC terminal. Bit 2 (AUD2MUX), located in the card control register, is programmed to route a CardBus CAUDIO PWM terminal to CAUDPWM. See Section 4.36, *Multifunction Routing Register*, for details on configuring the MFUNC terminals.

Figure 3–4 illustrates the SPKROUT connection.

Figure 3-4. SPKROUT Connection to Speaker Driver

3.5.9 LED Socket Activity Indicators

The socket activity LEDs are provided to indicate when a PC Card is being accessed. The LEDA1 and LEDA2 signals can be routed to the multifunction terminals. When configured for LED outputs, these terminals output an active high signal to indicate socket activity. LEDA1 indicates socket A (card A) activity, and LEDA2 indicates socket B (card B) activity. The LED_SKT output indicates socket activity to either socket A or socket B. See Section 4.36, *Multifunction Routing Status Register*, for details on configuring the multifunction terminals.

The active-high LED signal is driven for 64 ms. When the LED is not being driven high, it is driven to a low state. Either of the two circuits shown in Figure 3-5 can be implemented to provide LED signaling, and the board designer must implement the circuit that best fits the application.

The LED activity signals are valid when a card is inserted, powered, and not in reset. For PC Card-16, the LED activity signals are pulsed when $\overline{\text{READY}}(\overline{\text{IREQ}})$ is low. For CardBus cards, the LED activity signals are pulsed if $\overline{\text{CFRAME}}$, $\overline{\text{IRDY}}$, or $\overline{\text{CREQ}}$ are active.

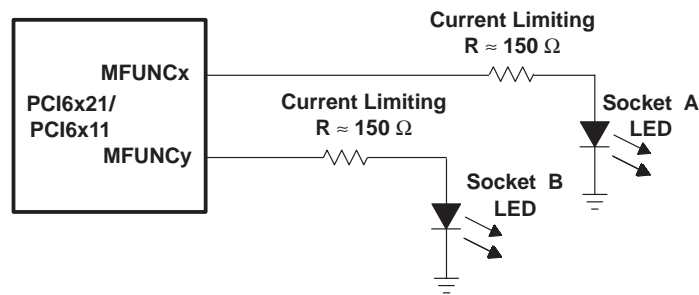

Figure 3-5. Two Sample LED Circuits

As indicated, the LED signals are driven for a period of 64 ms by a counter circuit. To avoid the possibility of the LEDs appearing to be stuck when the PCI clock is stopped, the LED signaling is cut off when the $\overline{\text{SUSPEND}}$ signal is asserted, when the PCI clock is to be stopped during the clock run protocol, or when in the D2 or D1 power state.

If any additional socket activity occurs during this counter cycle, then the counter is reset and the LED signal remains driven. If socket activity is frequent (at least once every 64 ms), then the LED signals remain driven.

3.5.10 CardBus Socket Registers

The PCI6x21/PCI6x11 controller contains all registers for compatibility with the *PCI Local Bus Specification* and the *PC Card Standard*. These registers, which exist as the CardBus socket registers, are listed in Table 3-6.

Table 3–6. CardBus Socket Registers

REGISTER NAME	OFFSET
Socket event	00h
Socket mask	04h
Socket present state	08h
Socket force event	0Ch
Socket control	10h
Reserved	14h–1Ch
Socket power management	20h

3.5.11 48-MHz Clock Requirements

The PCI6x21/PCI6x11 controller is designed to use an external 48-MHz clock connected to the CLK_48 terminal to provide the reference for an internal oscillator circuit. This oscillator in turn drives a PLL circuit that generates the various clocks required for the flash media function (Function 3) of the PCI6x21/PCI6x11 controller.

The 48-MHz clock must maintain a frequency of 48 MHz \pm 0.8% over normal operating conditions. This clock must maintain a duty cycle of 40% – 60%. The PCI6x21/PCI6x11 controller requires that the 48-MHz clock be running and stable (a minimum of 10 clock pulses) before a GRST deassertion.

The following are typical specifications for crystals used with the PCI6x21/PCI6x11 controller in order to achieve the required frequency accuracy and stability.

- Crystal mode of operation: Fundamental
- Frequency tolerance @ 25°C: Total frequency variation for the complete circuit is \pm 100 ppm. A crystal with \pm 30 ppm frequency tolerance is recommended for adequate margin.
- Frequency stability (over temperature and age): A crystal with \pm 30 ppm frequency stability is recommended for adequate margin.

NOTE: The total frequency variation must be kept below \pm 100 ppm from nominal with some allowance for error introduced by board and device variations. Trade-offs between frequency tolerance and stability may be made as long as the total frequency variation is less than \pm 100 ppm. For example, the frequency tolerance of the crystal may be specified at 50 ppm and the temperature tolerance may be specified at 30 ppm to give a total of 80 ppm possible variation due to the crystal alone. Crystal aging also contributes to the frequency variation.

3.6 Serial EEPROM Interface

The PCI6x21/PCI6x11 controller has a dedicated serial bus interface that can be used with an EEPROM to load certain registers in the PCI6x21/PCI6x11 controller. The EEPROM is detected by a pullup resistor on the SCL terminal. See Table 3–8 for the EEPROM loading map.

3.6.1 Serial-Bus Interface Implementation

The PCI6x21/PCI6x11 controller drives SCL at nearly 100 kHz during data transfers, which is the maximum specified frequency for standard mode I²C. The serial EEPROM must be located at address A0h.

Some serial device applications may include PC Card power switches, card ejectors, or other devices that may enhance the user's PC Card experience. The serial EEPROM device and PC Card power switches are discussed in the sections that follow.

3.6.2 Accessing Serial-Bus Devices Through Software

The PCI6x21/PCI6x11 controller provides a programming mechanism to control serial bus devices through software. The programming is accomplished through a doubleword of PCI configuration space at offset B0h. Table 3–7 lists the registers used to program a serial-bus device through software.

Table 3–7. PCI6x21/PCI6x11 Registers Used to Program Serial-Bus Devices

PCI OFFSET	REGISTER NAME	DESCRIPTION
B0h	Serial-bus data	Contains the data byte to send on write commands or the received data byte on read commands.
B1h	Serial-bus index	The content of this register is sent as the word address on byte writes or reads. This register is not used in the quick command protocol.
B2h	Serial-bus slave address	Write transactions to this register initiate a serial-bus transaction. The slave device address and the R/W command selector are programmed through this register.
B3h	Serial-bus control and status	Read data valid, general busy, and general error status are communicated through this register. In addition, the protocol-select bit is programmed through this register.

3.6.3 Serial-Bus Interface Protocol

The SCL and SDA signals are bidirectional, open-drain signals and require pullup resistors as shown in Figure 3–3. The PCI6x21/PCI6x11 controller, which supports up to 100-Kb/s data-transfer rate, is compatible with standard mode I²C using 7-bit addressing.

All data transfers are initiated by the serial bus master. The beginning of a data transfer is indicated by a start condition, which is signaled when the SDA line transitions to the low state while SCL is in the high state, as shown in Figure 3–6. The end of a requested data transfer is indicated by a stop condition, which is signaled by a low-to-high transition of SDA while SCL is in the high state, as shown in Figure 3–6. Data on SDA must remain stable during the high state of the SCL signal, as changes on the SDA signal during the high state of SCL are interpreted as control signals, that is, a start or a stop condition.

Figure 3–6. Serial-Bus Start/Stop Conditions and Bit Transfers

Data is transferred serially in 8-bit bytes. The number of bytes that may be transmitted during a data transfer is unlimited; however, each byte must be completed with an acknowledge bit. An acknowledge (ACK) is indicated by the receiver pulling the SDA signal low, so that it remains low during the high state of the SCL signal. Figure 3–7 illustrates the acknowledge protocol.

Figure 3–7. Serial-Bus Protocol Acknowledge

The PCI6x21/PCI6x11 controller is a serial bus master; all other devices connected to the serial bus external to the PCI6x21/PCI6x11 controller are slave devices. As the bus master, the PCI6x21/PCI6x11 controller drives the SCL clock at nearly 100 kHz during bus cycles and places SCL in a high-impedance state (zero frequency) during idle states.

Typically, the PCI6x21/PCI6x11 controller masters byte reads and byte writes under software control. Doubleword reads are performed by the serial EEPROM initialization circuitry upon a PCI reset and may not be generated under software control. See Section 3.6.4, *Serial-Bus EEPROM Application*, for details on how the PCI6x21/PCI6x11 controller automatically loads the subsystem identification and other register defaults through a serial-bus EEPROM.

Figure 3–8 illustrates a byte write. The PCI6x21/PCI6x11 controller issues a start condition and sends the 7-bit slave device address and the command bit zero. A 0 in the R/\overline{W} command bit indicates that the data transfer is a write. The slave device acknowledges if it recognizes the address. If no acknowledgment is received by the PCI6x21/PCI6x11 controller, then an appropriate status bit is set in the serial-bus control/status register (PCI offset B3h, see Section 4.50). The word address byte is then sent by the PCI6x21/PCI6x11 controller, and another slave acknowledgment is expected. Then the PCI6x21/PCI6x11 controller delivers the data byte MSB first and expects a final acknowledgment before issuing the stop condition.

Figure 3–8. Serial-Bus Protocol—Byte Write

Figure 3–9 illustrates a byte read. The read protocol is very similar to the write protocol, except the R/\overline{W} command bit must be set to 1 to indicate a read-data transfer. In addition, the PCI6x21/PCI6x11 master must acknowledge reception of the read bytes from the slave transmitter. The slave transmitter drives the SDA signal during read data transfers. The SCL signal remains driven by the PCI6x21/PCI6x11 master.

Figure 3–9. Serial-Bus Protocol—Byte Read

Figure 3–10 illustrates EEPROM interface doubleword data collection protocol.

Figure 3–10. EEPROM Interface Doubleword Data Collection

3.6.4 Serial-Bus EEPROM Application

When the PCI bus is reset and the serial-bus interface is detected, the PCI6x21/PCI6x11 controller attempts to read the subsystem identification and other register defaults from a serial EEPROM.

This format must be followed for the PCI6x21/PCI6x11 controller to load initializations from a serial EEPROM. All bit fields must be considered when programming the EEPROM.

The serial EEPROM is addressed at slave address 1010 000b by the PCI6x21/PCI6x11 controller. All hardware address bits for the EEPROM must be tied to the appropriate level to achieve this address. The serial EEPROM chip in the sample application (Figure 3–10) assumes the 1010b high-address nibble. The lower three address bits are terminal inputs to the chip, and the sample application shows these terminal inputs tied to GND.

Table 3–8. EEPROM Loading Map

SERIAL ROM OFFSET	BYTE DESCRIPTION							
00h	CardBus function indicator (00h)

5Fh	End-of-list indicator (80h)

3.7 Programmable Interrupt Subsystem

Interrupts provide a way for I/O devices to let the microprocessor know that they require servicing. The dynamic nature of PC Cards and the abundance of PC Card I/O applications require substantial interrupt support from the PCI6x21/PCI6x11 controller. The PCI6x21/PCI6x11 controller provides several interrupt signaling schemes to accommodate the needs of a variety of platforms. The different mechanisms for dealing with interrupts in this controller are based on various specifications and industry standards. The ExCA register set provides interrupt control for some 16-bit PC Card functions, and the CardBus socket register set provides interrupt control for the CardBus PC Card functions. The PCI6x21/PCI6x11 controller is, therefore, backward compatible with existing interrupt control register definitions, and new registers have been defined where required.

The PCI6x21/PCI6x11 controller detects PC Card interrupts and events at the PC Card interface and notifies the host controller using one of several interrupt signaling protocols. To simplify the discussion of interrupts in the PCI6x21/PCI6x11 controller, PC Card interrupts are classified either as card status change (CSC) or as functional interrupts.

The method by which any type of PCI6x21/PCI6x11 interrupt is communicated to the host interrupt controller varies from system to system. The PCI6x21/PCI6x11 controller offers system designers the choice of using parallel PCI interrupt signaling, parallel ISA-type IRQ interrupt signaling, or the IRQSER serialized ISA and/or PCI interrupt protocol. It is possible to use the parallel PCI interrupts in combination with either parallel IRQs or serialized IRQs, as detailed in the sections that follow. All interrupt signaling is provided through the seven multifunction terminals, MFUNC0–MFUNC6.

3.7.1 PC Card Functional and Card Status Change Interrupts

PC Card functional interrupts are defined as requests from a PC Card application for interrupt service and are indicated by asserting specially-defined signals on the PC Card interface. Functional interrupts are generated by 16-bit I/O PC Cards and by CardBus PC Cards.

Card status change (CSC)-type interrupts are defined as events at the PC Card interface that are detected by the PCI6x21/PCI6x11 controller and may warrant notification of host card and socket services software for service. CSC events include both card insertion and removal from PC Card sockets, as well as transitions of certain PC Card signals.

Table 3–9 summarizes the sources of PC Card interrupts and the type of card associated with them. CSC and functional interrupt sources are dependent on the type of card inserted in the PC Card socket. The four types of cards that can be inserted into any PC Card socket are:

- 16-bit memory card
- 16-bit I/O card
- CardBus cards
- UltraMedia card

Table 3–9. Interrupt Mask and Flag Registers

CARD TYPE	EVENT	MASK	FLAG
16-bit memory	Battery conditions (BVD1, BVD2)	ExCA offset 05h/45h/805h bits 1 and 0	ExCA offset 04h/44h/804h bits 1 and 0
	Wait states (READY)	ExCA offset 05h/45h/805h bit 2	ExCA offset 04h/44h/804h bit 2
16-bit I/O	Change in card status (STSCHG)	ExCA offset 05h/45h/805h bit 0	ExCA offset 04h/44h/804h bit 0
16-bit I/O/ UltraMedia	Interrupt request ($\overline{\text{IREQ}}$)	Always enabled	PCI configuration offset 91h bit 0
All 16-bit PC Cards/ Smart Card adapters/ UltraMedia/ Flash Media	Power cycle complete	ExCA offset 05h/45h/805h bit 3	ExCA offset 04h/44h/804h bit 3
CardBus	Change in card status (CSTSCHG)	Socket mask bit 0	Socket event bit 0
	Interrupt request ($\overline{\text{CINT}}$)	Always enabled	PCI configuration offset 91h bit 0
	Power cycle complete	Socket mask bit 3	Socket event bit 3
	Card insertion or removal	Socket mask bits 2 and 1	Socket event bits 2 and 1

Functional interrupt events are valid only for 16-bit I/O and CardBus cards; that is, the functional interrupts are not valid for 16-bit memory cards. Furthermore, card insertion and removal-type CSC interrupts are independent of the card type.

Table 3–10. PC Card Interrupt Events and Description

CARD TYPE	EVENT	TYPE	SIGNAL	DESCRIPTION
16-bit memory	Battery conditions (BVD1, BVD2)	CSC	BVD1($\overline{\text{STSCHG}}$)/CSTSCHG	A transition on BVD1 indicates a change in the PC Card battery conditions.
			BVD2($\overline{\text{SPKR}}$)/CAUDIO	A transition on BVD2 indicates a change in the PC Card battery conditions.
	Wait states (READY)	CSC	READY($\overline{\text{IREQ}}$)/ $\overline{\text{CINT}}$	A transition on READY indicates a change in the ability of the memory PC Card to accept or provide data.
16-bit I/O	Change in card status (STSCHG)	CSC	BVD1($\overline{\text{STSCHG}}$)/CSTSCHG	The assertion of $\overline{\text{STSCHG}}$ indicates a status change on the PC Card.
16-bit I/O/ UltraMedia	Interrupt request ($\overline{\text{IREQ}}$)	Functional	READY($\overline{\text{IREQ}}$)/ $\overline{\text{CINT}}$	The assertion of $\overline{\text{IREQ}}$ indicates an interrupt request from the PC Card.
CardBus	Change in card status (CSTSCHG)	CSC	BVD1($\overline{\text{STSCHG}}$)/CSTSCHG	The assertion of CSTSCHG indicates a status change on the PC Card.
	Interrupt request ($\overline{\text{CINT}}$)	Functional	READY($\overline{\text{IREQ}}$)/ $\overline{\text{CINT}}$	The assertion of $\overline{\text{CINT}}$ indicates an interrupt request from the PC Card.
All PC Cards/ Smart Card adapters/ UltraMedia/ Flash Media	Card insertion or removal	CSC	$\overline{\text{CD1}}/\overline{\text{CCD1}}$, $\overline{\text{CD2}}/\overline{\text{CCD2}}$	A transition on either $\overline{\text{CD1}}/\overline{\text{CCD1}}$ or $\overline{\text{CD2}}/\overline{\text{CCD2}}$ indicates an insertion or removal of a 16-bit or CardBus PC Card.
	Power cycle complete	CSC	N/A	An interrupt is generated when a PC Card power-up cycle has completed.

The naming convention for PC Card signals describes the function for 16-bit memory, I/O cards, and CardBus. For example, READY($\overline{\text{IREQ}}$)/ $\overline{\text{CINT}}$ includes READY for 16-bit memory cards, $\overline{\text{IREQ}}$ for 16-bit I/O cards, and $\overline{\text{CINT}}$ for CardBus cards. The 16-bit memory card signal name is first, with the I/O card signal name second, enclosed in parentheses. The CardBus signal name follows after a double slash (/).

The *1997 PC Card Standard* describes the power-up sequence that must be followed by the PCI6x21/PCI6x11 controller when an insertion event occurs and the host requests that the socket V_{CC} and V_{pp} be powered. Upon completion of this power-up sequence, the PCI6x21/PCI6x11 interrupt scheme can be used to notify the host system (see Table 3–10), denoted by the power cycle complete event. This interrupt source is considered a

PCI6x21/PCI6x11 internal event, because it depends on the completion of applying power to the socket rather than on a signal change at the PC Card interface.

3.7.2 Interrupt Masks and Flags

Host software may individually mask (or disable) most of the potential interrupt sources listed in Table 3–10 by setting the appropriate bits in the PCI6x21/PCI6x11 controller. By individually masking the interrupt sources listed, software can control those events that cause a PCI6x21/PCI6x11 interrupt. Host software has some control over the system interrupt the PCI6x21/PCI6x11 controller asserts by programming the appropriate routing registers. The PCI6x21/PCI6x11 controller allows host software to route PC Card CSC and PC Card functional interrupts to separate system interrupts. Interrupt routing somewhat specific to the interrupt signaling method used is discussed in more detail in the following sections.

When an interrupt is signaled by the PCI6x21/PCI6x11 controller, the interrupt service routine must determine which of the events listed in Table 3–9 caused the interrupt. Internal registers in the PCI6x21/PCI6x11 controller provide flags that report the source of an interrupt. By reading these status bits, the interrupt service routine can determine the action to be taken.

Table 3–9 details the registers and bits associated with masking and reporting potential interrupts. All interrupts can be masked except the functional PC Card interrupts, and an interrupt status flag is available for all types of interrupts.

Notice that there is not a mask bit to stop the PCI6x21/PCI6x11 controller from passing PC Card functional interrupts through to the appropriate interrupt scheme. These interrupts are not valid until the card is properly powered, and there must never be a card interrupt that does not require service after proper initialization.

Table 3–9 lists the various methods of clearing the interrupt flag bits. The flag bits in the ExCA registers (16-bit PC Card-related interrupt flags) can be cleared using two different methods. One method is an explicit write of 1 to the flag bit to clear and the other is by reading the flag bit register. The selection of flag bit clearing methods is made by bit 2 (IFCMODE) in the ExCA global control register (ExCA offset 1Eh/5Eh/81Eh, see Section 5.20), and defaults to the flag-cleared-on-read method.

The CardBus-related interrupt flags can be cleared by an explicit write of 1 to the interrupt flag in the socket event register (see Section 6.1). Although some of the functionality is shared between the CardBus registers and the ExCA registers, software must not program the chip through both register sets when a CardBus card is functioning.

3.7.3 Using Parallel IRQ Interrupts

The seven multifunction terminals, MFUNC6–MFUNC0, implemented in the PCI6x21/PCI6x11 controller can be routed to obtain a subset of the ISA IRQs. The IRQ choices provide ultimate flexibility in PC Card host interruptions. To use the parallel ISA-type IRQ interrupt signaling, software must program the device control register (PCI offset 92h, see Section 4.39), to select the parallel IRQ signaling scheme. See Section 4.36, *Multifunction Routing Status Register*, for details on configuring the multifunction terminals.

A system using parallel IRQs requires (at a minimum) one PCI terminal, $\overline{\text{INTA}}$, to signal CSC events. This requirement is dictated by certain card and socket-services software. The $\overline{\text{INTA}}$ requirement calls for routing the MFUNC0 terminal for $\overline{\text{INTA}}$ signaling. The INTRTIE bit is used, in this case, to route socket interrupt events to $\overline{\text{INTA}}$. This leaves (at a maximum) six different IRQs to support legacy 16-bit PC Card functions.

As an example, suppose the six IRQs used by legacy PC Card applications are IRQ3, IRQ4, IRQ5, IRQ9, IRQ10, and IRQ15. The multifunction routing status register must be programmed to a value of 0A9F 5432h. This value routes the MFUNC0 terminal to $\overline{\text{INTA}}$ signaling and routes the remaining terminals as illustrated in Figure 3–11. Not shown is that $\overline{\text{INTA}}$ must also be routed to the programmable interrupt controller (PIC), or to some circuitry that provides parallel PCI interrupts to the host.

Figure 3–11. IRQ Implementation

Power-on software is responsible for programming the multifunction routing status register to reflect the IRQ configuration of a system implementing the PCI6x21/PCI6x11 controller. The multifunction routing status register is a global register that is shared between the four PCI6x21/PCI6x11 functions. See Section 4.36, *Multifunction Routing Status Register*, for details on configuring the multifunction terminals.

The parallel ISA-type IRQ signaling from the MFUNC6–MFUNC0 terminals is compatible with the input signal requirements of the 8259 PIC. The parallel IRQ option is provided for system designs that require legacy ISA IRQs. Design constraints may demand more MFUNC6–MFUNC0 IRQ terminals than the PCI6x21/PCI6x11 controller makes available.

3.7.4 Using Parallel PCI Interrupts

Parallel PCI interrupts are available when exclusively in parallel PCI interrupt/parallel ISA IRQ signaling mode, and when only IRQs are serialized with the IRQSER protocol. The \overline{INTA} , \overline{INTB} , \overline{INTC} , and \overline{INTD} can be routed to MFUNC terminals (MFUNC0, MFUNC1, MFUNC2, and MFUNC4). If bit 29 (INTRTIE) is set in the system control register (PCI offset 80h, see Section 4.29), then \overline{INTA} and \overline{INTB} are tied internally. When the TIEALL bit is set, all four functions return a value of 01h on reads from the interrupt pin register for both parallel and serial PCI interrupts.

The INTRTIE and TIEALL bits affect the read-only value provided through accesses to the interrupt pin register (PCI offset 3Dh, see Section 4.24). Table 3–11 summarizes the interrupt signaling modes.

Table 3–11. Interrupt Pin Register Cross Reference

INTRTIE Bit	TIEALL Bit	INTPIN Function 0 (CardBus)	INTPIN Function 1 (CardBus)	INTPIN Function 3 (Flash Media)	INTPIN Function 4 (SD Host)	INTPIN Function 5 (Smart Card)
0	0	0x01 (\overline{INTA})	0x02 (\overline{INTB})	Determined by bits 6–5 (INT_SEL field) in flash media general control register (see Section 7.21)	Determined by bits 6–5 (INT_SEL field) in SD host general control register (see Section 8.22)	Determined by bits 6–5 (INT_SEL field) in Smart Card general control register (see Section 9.22)
1	0	0x01 (\overline{INTA})	0x01 (\overline{INTA})			
X	1	0x01 (\overline{INTA})	0x01 (\overline{INTA})	0x01 (\overline{INTA})	0x01 (\overline{INTA})	0x01 (\overline{INTA})

3.7.5 Using Serialized IRQSER Interrupts

The serialized interrupt protocol implemented in the PCI6x21/PCI6x11 controller uses a single terminal to communicate all interrupt status information to the host controller. The protocol defines a serial packet consisting of a start cycle, multiple interrupt indication cycles, and a stop cycle. All data in the packet is synchronous with the PCI clock. The packet data describes 16 parallel ISA IRQ signals and the optional 4 PCI interrupts \overline{INTA} , \overline{INTB} , \overline{INTC} , and \overline{INTD} . For details on the IRQSER protocol, refer to the document *Serialized IRQ Support for PCI Systems*.

3.7.6 SMI Support in the PCI6x21/PCI6x11 Controller

The PCI6x21/PCI6x11 controller provides a mechanism for interrupting the system when power changes have been made to the PC Card socket interfaces. The interrupt mechanism is designed to fit into a system maintenance interrupt (SMI) scheme. SMI interrupts are generated by the PCI6x21/PCI6x11 controller, when enabled, after a write cycle to either the socket control register (CB offset 10h, see Section 6.5) of the CardBus register set, or the ExCA power control register (ExCA offset 02h/42h/802h, see Section 5.3) causes a power cycle change sequence to be sent on the power switch interface.

The SMI control is programmed through three bits in the system control register (PCI offset 80h, see Section 4.29). These bits are SMIRROUTE (bit 26), SMISTATUS (bit 25), and SMIENB (bit 24). Table 3–12 describes the SMI control bits function.

Table 3–12. SMI Control

BIT NAME	FUNCTION
SMIRROUTE	This shared bit controls whether the SMI interrupts are sent as a CSC interrupt or as IRQ2.
SMISTAT	This socket-dependent bit is set when an SMI interrupt is pending. This status flag is cleared by writing back a 1.
SMIENB	When set, SMI interrupt generation is enabled. This bit is shared by functions 0 and 1.

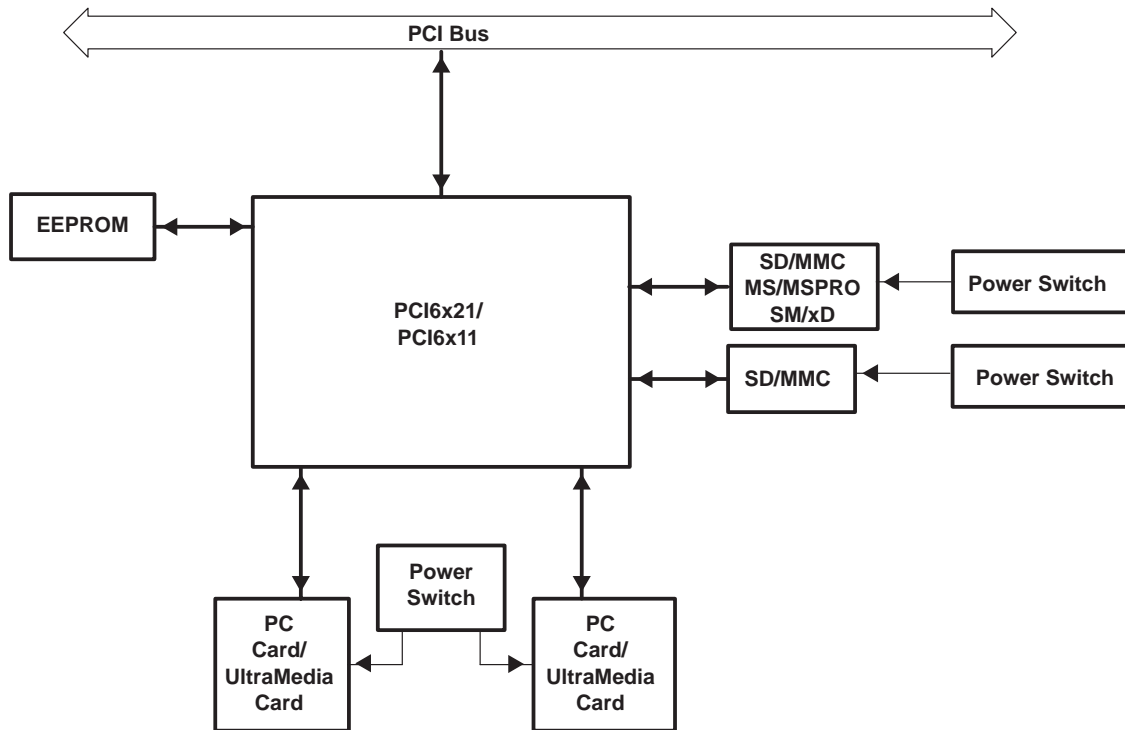

If CSC SMI interrupts are selected, then the SMI interrupt is sent as the CSC on a per-socket basis. The CSC interrupt can be either level or edge mode, depending upon the CSCMODE bit in the ExCA global control register (ExCA offset 1Eh/5Eh/81Eh, see Section 5.20).

If IRQ2 is selected by SMIRROUTE, then the IRQSER signaling protocol supports SMI signaling in the IRQ2 IRQ/Data slot. In a parallel ISA IRQ system, the support for an active low IRQ2 is provided only if IRQ2 is routed to either MFUNC3 or MFUNC6 through the multifunction routing status register (PCI offset 8Ch, see Section 4.36).

3.8 Power Management Overview

In addition to the low-power CMOS technology process used for the PCI6x21/PCI6x11 controller, various features are designed into the controller to allow implementation of popular power-saving techniques. These features and techniques are as follows:

- Clock run protocol
- Cardbus PC Card power management
- 16-bit PC Card power management
- Suspend mode
- Ring indicate
- PCI power management
- Cardbus bridge power management
- ACPI support

† The system connection to $\overline{\text{GRST}}$ is implementation-specific. $\overline{\text{GRST}}$ must be asserted on initial power up of the PCI6x21/PCI6x11 controller. $\overline{\text{PRST}}$ must be asserted for subsequent warm resets.

Figure 3–12. System Diagram Implementing CardBus Device Class Power Management

3.8.1 Integrated Low-Dropout Voltage Regulator (LDO-VR)

The PCI6x21/PCI6x11 controller requires 1.5-V core voltage. The core power can be supplied by the PCI6x21/PCI6x11 controller itself using the internal LDO-VR. The core power can alternatively be supplied by an external power supply through the VR_PORT terminal. Table 3–13 lists the requirements for both the internal core power supply and the external core power supply.

Table 3–13. Requirements for Internal/External 1.5-V Core Power Supply

SUPPLY	V _{CC}	$\overline{\text{VR_EN}}$	VR_PORT	NOTE
Internal	3.3 V	GND	1.5-V output	Internal 1.5-V LDO-VR is enabled. A 1.0- μF bypass capacitor is required on the VR_PORT terminal for decoupling. This output is not for external use.
External	3.3 V	V _{CC}	1.5-V input	Internal 1.5-V LDO-VR is disabled. An external 1.5-V power supply, of minimum 50-mA capacity, is required. A 0.1- μF bypass capacitor on the VR_PORT terminal is required.

3.8.2 CardBus (Functions 0 and 1) Clock Run Protocol

The PCI $\overline{\text{CLKRUN}}$ feature is the primary method of power management on the PCI interface of the PCI6x21/PCI6x11 controller. $\overline{\text{CLKRUN}}$ signaling is provided through the MFUNC6 terminal. Since some chip sets do not implement $\overline{\text{CLKRUN}}$, this is not always available to the system designer, and alternate power-saving features are provided. For details on the $\overline{\text{CLKRUN}}$ protocol see the *PCI Mobile Design Guide*.

The PCI6x21/PCI6x11 controller does not permit the central resource to stop the PCI clock under any of the following conditions:

- Bit 1 (KEEPCLK) in the system control register (PCI offset 80h, see Section 4.29) is set.
- The 16-bit PC Card resource manager is busy.
- The PCI6x21/PCI6x11 CardBus master state machine is busy. A cycle may be in progress on CardBus.

- The PCI6x21/PCI6x11 master is busy. There may be posted data from CardBus to PCI in the PCI6x21/PCI6x11 controller.
- Interrupts are pending.
- The CardBus CCLK for the socket has not been stopped by the PCI6x21/PCI6x11 $\overline{\text{CCLKRUN}}$ manager.
- PC Card interrogation is in progress.

The PCI6x21/PCI6x11 controller restarts the PCI clock using the $\overline{\text{CLKRUN}}$ protocol under any of the following conditions:

- A 16-bit PC Card $\overline{\text{IREQ}}$ or a CardBus $\overline{\text{CINT}}$ has been asserted by either card.
- A CardBus CBWAKE (CSTSCHG) or 16-bit PC Card $\overline{\text{STSCHG/RI}}$ event occurs in the socket.
- A CardBus attempts to start the CCLK using $\overline{\text{CCLKRUN}}$.
- A CardBus card arbitrates for the CardBus bus using $\overline{\text{CREQ}}$.
- Bit 1 (KEEPCLK) in the system control register (PCI offset 80h, see Section 4.29) is set.
- Data is in any of the FIFOs (receive or transmit).
- The master state machine is busy.
- There are pending interrupts.

3.8.3 CardBus PC Card Power Management

The PCI6x21/PCI6x11 controller implements its own card power-management engine that can turn off the CCLK to a socket when there is no activity to the CardBus PC Card. The PCI clock-run protocol is followed on the CardBus $\overline{\text{CCLKRUN}}$ interface to control this clock management.

3.8.4 16-Bit PC Card Power Management

The COE bit (bit 7) of the ExCA power control register (ExCA offset 02h/42h/802h, see Section 5.3) and PWRDWN bit (bit 0) of the ExCA global control register (ExCA offset 1Eh/5Eh/81Eh, see Section 5.20) are provided for 16-bit PC Card power management. The COE bit places the card interface in a high-impedance state to save power. The power savings when using this feature are minimal. The COE bit resets the PC Card when used, and the PWRDWN bit does not. Furthermore, the PWRDWN bit is an automatic COE, that is, the PWRDWN performs the COE function when there is no card activity.

NOTE: The 16-bit PC Card must implement the proper pullup resistors for the COE and PWRDWN modes.

3.8.5 Suspend Mode

The $\overline{\text{SUSPEND}}$ signal, provided for backward compatibility, gates the $\overline{\text{PRST}}$ (PCI reset) signal and the $\overline{\text{GRST}}$ (global reset) signal from the PCI6x21/PCI6x11 controller. Besides gating $\overline{\text{PRST}}$ and $\overline{\text{GRST}}$, $\overline{\text{SUSPEND}}$ also gates PCLK inside the PCI6x21/PCI6x11 controller in order to minimize power consumption.

It should also be noted that asynchronous signals, such as card status change interrupts and $\overline{\text{RI_OUT}}$, can be passed to the host system without a PCI clock. However, if card status change interrupts are routed over the serial interrupt stream, then the PCI clock must be restarted in order to pass the interrupt, because neither the internal oscillator nor an external clock is routed to the serial-interrupt state machine. Figure 3–13 is a signal diagram of the suspend function.

Figure 3–13. Signal Diagram of Suspend Function

3.8.6 Requirements for Suspend Mode

The suspend mode prevents the clearing of all register contents on the assertion of reset ($\overline{\text{PRST}}$ or $\overline{\text{GRST}}$) which would require the reconfiguration of the PCI6x21/PCI6x11 controller by software. Asserting the $\overline{\text{SUSPEND}}$ signal places the PCI outputs of the controller in a high-impedance state and gates the PCLK signal internally to the controller unless a PCI transaction is currently in process ($\overline{\text{GNT}}$ is asserted). It is important that the PCI bus not be parked on the PCI6x21/PCI6x11 controller when $\overline{\text{SUSPEND}}$ is asserted because the outputs are in a high-impedance state.

The GPIOs, MFUNC signals, and $\overline{\text{RI_OUT}}$ signal are all active during $\overline{\text{SUSPEND}}$, unless they are disabled in the appropriate PCI6x21/PCI6x11 registers.

3.8.7 Ring Indicate

The $\overline{\text{RI_OUT}}$ output is an important feature in power management, allowing a system to go into a suspended mode and wake-up on modem rings and other card events. TI-designed flexibility permits this signal to fit wide platform requirements. $\overline{\text{RI_OUT}}$ on the PCI6x21/PCI6x11 controller can be asserted under any of the following conditions:

- A 16-bit PC Card modem in a powered socket asserts $\overline{\text{RI}}$ to indicate to the system the presence of an incoming call.
- A powered down CardBus card asserts CSTSCHG (CBWAKE) requesting system and interface wake-up.
- A powered CardBus card asserts CSTSCHG from the insertion/removal of cards or change in battery voltage levels.

Figure 3–14 shows various enable bits for the PCI6x21/PCI6x11 $\overline{\text{RI_OUT}}$ function; however, it does not show the masking of CSC events. See Table 3–9 for a detailed description of CSC interrupt masks and flags.

Figure 3-14. $\overline{RI_OUT}$ Functional Diagram

\overline{RI} from the 16-bit PC Card interface is masked by bit 7 (RINGEN) in the ExCA interrupt and general control register (ExCA offset 03h/43h/803h, see Section 5.4). This is programmed on a per-socket basis and is only applicable when a 16-bit card is powered in the socket.

The CBWAKE signaling to $\overline{RI_OUT}$ is enabled through the same mask as the CSC event for CSTSCHG. The mask bit (bit 0, CSTSMASK) is programmed through the socket mask register (CB offset 04h, see Section 6.2) in the CardBus socket registers.

$\overline{RI_OUT}$ can be routed through any of three different pins, $\overline{RI_OUT/PME}$, MFUNC2, or MFUNC4. The $\overline{RI_OUT}$ function is enabled by setting bit 7 (RIENB) in the card control register (PCI offset 91h, see Section 4.38). The \overline{PME} function is enabled by setting bit 8 (PME_ENABLE) in the power-management control/status register (PCI offset A4h, see Section 4.44). When bit 0 (RIMUX) in the system control register (PCI offset 80h, see Section 4.29) is set to 0, both the $\overline{RI_OUT}$ function and the \overline{PME} function are routed to the $\overline{RI_OUT/PME}$ terminal. If both functions are enabled and RIMUX is set to 0, then the $\overline{RI_OUT/PME}$ terminal becomes $\overline{RI_OUT}$ only and \overline{PME} assertions are never seen. Therefore, in a system using both the $\overline{RI_OUT}$ function and the \overline{PME} function, RIMUX must be set to 1 and $\overline{RI_OUT}$ must be routed to either MFUNC2 or MFUNC4.

3.8.8 PCI Power Management

3.8.8.1 CardBus Power Management (Functions 0 and 1)

The *PCI Bus Power Management Interface Specification for PCI to CardBus Bridges* establishes the infrastructure required to let the operating system control the power of PCI functions. This is done by defining a standard PCI interface and operations to manage the power of PCI functions on the bus. The PCI bus and the PCI functions can be assigned one of seven power-management states, resulting in varying levels of power savings.

The seven power-management states of PCI functions are:

- D0-uninitialized – Before controller configuration, controller not fully functional
- D0-active – Fully functional state
- D1 – Low-power state
- D2 – Low-power state
- D3_{hot} – Low-power state. Transition state before D3_{cold}
- D3_{cold} – \overline{PME} signal-generation capable. Main power is removed and VAUX is available.
- D3_{off} – No power and completely nonfunctional

NOTE 1: In the D0-uninitialized state, the PCI6x21/PCI6x11 controller does not generate \overline{PME} and/or interrupts. When bits 0 (IO_EN) and 1 (MEM_EN) of the command register (PCI offset 04h, see Section 4.4) are both set, the PCI6x21/PCI6x11 controller switches the state to D0-active. Transition from D3_{cold} to the D0-uninitialized state happens at the deassertion of PRST. The assertion of GRST forces the controller to the D0-uninitialized state immediately.

NOTE 2: The PWR_STATE bits (bits 1-0) of the power-management control/status register (PCI offset A4h, see Section 4.44) only code for four power states, D0, D1, D2, and D3_{hot}. The differences between the three D3 states is invisible to the software because the controller is not accessible in the D3_{cold} or D3_{off} state.

Similarly, bus power states of the PCI bus are B0–B3. The bus power states B0–B3 are derived from the device power state of the originating bridge device.

For the operating system (OS) to manage the controller power states on the PCI bus, the PCI function must support four power-management operations. These operations are:

- Capabilities reporting
- Power status reporting
- Setting the power state
- System wake-up

The OS identifies the capabilities of the PCI function by traversing the new capabilities list. The presence of capabilities in addition to the standard PCI capabilities is indicated by a 1 in bit 4 (CAPLIST) of the status register (PCI offset 06h, see Section 4.5).

The capabilities pointer provides access to the first item in the linked list of capabilities. For the PCI6x21/PCI6x11 controller, a CardBus bridge with PCI configuration space header type 2, the capabilities pointer is mapped to an offset of 14h. The first byte of each capability register block is required to be a unique ID of that capability. PCI power management has been assigned an ID of 01h. The next byte is a pointer to the next pointer item in the list of capabilities. If there are no more items in the list, then the next item pointer must be set to 0. The registers following the next item pointer are specific to the capability of the function. The PCI power-management capability implements the register block outlined in Table 3–14.

Table 3–14. Power-Management Registers

REGISTER NAME			OFFSET	
Power-management capabilities		Next item pointer	Capability ID	A0h
Data	Power-management control/status register bridge support extensions	Power-management control/status (CSR)		A4h

The power-management capabilities register (PCI offset A2h, see Section 4.43) provides information on the capabilities of the function related to power management. The power-management control/status register (PCI offset A4h, see Section 4.44) enables control of power-management states and enables/monitors power-management events. The data register is an optional register that can provide dynamic data.

For more information on PCI power management, see the *PCI Bus Power Management Interface Specification for PCI to CardBus Bridges*.

3.8.8.2 Flash Media (Function 3) Power Management

The *PCI Bus Power Management Interface Specification* is applicable for the flash media dedicated sockets. This function supports the D0 and D3 power states.

Table 3–15. Function 3 Power-Management Registers

REGISTER NAME			OFFSET	
Power-management capabilities		Next item pointer	Capability ID	44h
Data	Power-management control/status register bridge support extensions	Power-management control/status (CSR)		48h

3.8.8.3 SD Host (Function 4) Power Management

The *PCI Bus Power Management Interface Specification* is applicable for the SD host dedicated sockets. This function supports the D0 and D3 power states.

Table 3–16. Function 4 Power-Management Registers

REGISTER NAME			OFFSET	
Power-management capabilities		Next item pointer	Capability ID	80h
Data	Power-management control/status register bridge support extensions	Power-management control/status (CSR)		84h

3.8.8.4 Smart Card (Function 5) Power Management

The *PCI Bus Power Management Interface Specification* is applicable for the Smart Card dedicated sockets. This function supports the D0 and D3 power states.

Table 3–17. Function 5 Power-Management Registers

REGISTER NAME			OFFSET
Power-management capabilities		Next item pointer	44h

3.8.9 CardBus Bridge Power Management

The *PCI Bus Power Management Interface Specification for PCI to CardBus Bridges* was approved by PCMCIA in December of 1997. This specification follows the device and bus state definitions provided in the *PCI Bus Power Management Interface Specification* published by the PCI Special Interest Group (SIG). The main issue addressed in the *PCI Bus Power Management Interface Specification for PCI to CardBus Bridges* is wake-up from D3_{hot} or D3_{cold} without losing wake-up context (also called $\overline{\text{PME}}$ context).

The specific issues addressed by the *PCI Bus Power Management Interface Specification for PCI to CardBus Bridges* for D3 wake-up are as follows:

- Preservation of device context. The specification states that a reset must occur during the transition from D3 to D0. Some method to preserve wake-up context must be implemented so that the reset does not clear the $\overline{\text{PME}}$ context registers.
- Power source in D3_{cold} if wake-up support is required from this state.

The Texas Instruments PCI6x21/PCI6x11 controller addresses these D3 wake-up issues in the following manner:

- Two resets are provided to handle preservation of $\overline{\text{PME}}$ context bits:
 - Global reset ($\overline{\text{GRST}}$) is used only on the initial boot up of the system after power up. It places the PCI6x21/PCI6x11 controller in its default state and requires BIOS to configure the controller before becoming fully functional.
 - PCI reset ($\overline{\text{PRST}}$) has dual functionality based on whether $\overline{\text{PME}}$ is enabled or not. If $\overline{\text{PME}}$ is enabled, then $\overline{\text{PME}}$ context is preserved. If $\overline{\text{PME}}$ is not enabled, then $\overline{\text{PRST}}$ acts the same as a normal PCI reset. Please see the master list of $\overline{\text{PME}}$ context bits in Section 3.8.11.
- Power source in D3_{cold} if wake-up support is required from this state. Since V_{CC} is removed in D3_{cold}, an auxiliary power source must be supplied to the PCI6x21/PCI6x11 V_{CC} terminals. Consult the *PCI14xx Implementation Guide for D3 Wake-Up* or the *PCI Power Management Interface Specification for PCI to CardBus Bridges* for further information.

3.8.10 ACPI Support

The *Advanced Configuration and Power Interface (ACPI) Specification* provides a mechanism that allows unique pieces of hardware to be described to the ACPI driver. The PCI6x21/PCI6x11 controller offers a generic interface that is compliant with ACPI design rules.

Two doublewords of general-purpose ACPI programming bits reside in PCI6x21/PCI6x11 PCI configuration space at offset 88h. The programming model is broken into status and control functions. In compliance with ACPI, the top level event status and enable bits reside in the general-purpose event status register (PCI offset 88h, see Section 4.32) and general-purpose event enable register (PCI offset 89h, see Section 4.33). The status and enable bits are implemented as defined by ACPI and illustrated in Figure 3–15.

Figure 3–15. Block Diagram of a Status/Enable Cell

The status and enable bits generate an event that allows the ACPI driver to call a control method associated with the pending status bit. The control method can then control the hardware by manipulating the hardware control bits or

by investigating child status bits and calling their respective control methods. A hierarchical implementation would be somewhat limiting, however, as upstream devices would have to remain in some level of power state to report events.

For more information of ACPI, see the *Advanced Configuration and Power Interface (ACPI) Specification*.

3.8.11 Master List of $\overline{\text{PME}}$ Context Bits and Global Reset-Only Bits

$\overline{\text{PME}}$ context bit means that the bit is cleared only by the assertion of $\overline{\text{GRST}}$ when the $\overline{\text{PME}}$ enable bit, bit 8 of the power management control/status register (PCI offset A4h, see Section 4.44) is set. If $\overline{\text{PME}}$ is not enabled, then these bits are cleared when either $\overline{\text{PRST}}$ or $\overline{\text{GRST}}$ is asserted.

The $\overline{\text{PME}}$ context bits (functions 0 and 1) are:

- Bridge control register (PCI offset 3Eh, see Section 4.25): bit 6
- System control register (PCI offset 80h, see Section 4.29): bits 10–8
- Power management control/status register (PCI offset A4h, see Section 4.44): bit 15
- ExCA power control register (ExCA 802h/842h, see Section 5.3): bits 7, 5 (82365SL mode only), 4, 3, 1, 0
- ExCA interrupt and general control (ExCA 803h/843h, see Section 5.4): bits 6, 5
- ExCA card status-change register (ExCA 804h/844h, see Section 5.5): bits 3–0
- ExCA card status-change interrupt configuration register (ExCA 805h/845h, see Section 5.6): bits 3–0
- ExCA card detect and general control register (ExCA 816h/856h, see Section 5.19): bits 7, 6
- Socket event register (CardBus offset 00h, see Section 6.1): bits 3–0
- Socket mask register (CardBus offset 04h, see Section 6.2): bits 3–0
- Socket present state register (CardBus offset 08h, see Section 6.3): bits 13–7, 5–1
- Socket control register (CardBus offset 10h, see Section 6.5): bits 6–4, 2–0

Global reset-only bits, as the name implies, are cleared only by $\overline{\text{GRST}}$. These bits are never cleared by $\overline{\text{PRST}}$, regardless of the setting of the $\overline{\text{PME}}$ enable bit. The $\overline{\text{GRST}}$ signal is gated only by the $\overline{\text{SUSPEND}}$ signal. This means that assertion of $\overline{\text{SUSPEND}}$ blocks the $\overline{\text{GRST}}$ signal internally, thus preserving all register contents. Figure 3–12 is a diagram showing the application of $\overline{\text{GRST}}$ and $\overline{\text{PRST}}$.

The global reset-only bits (functions 0 and 1) are:

- Status register (PCI offset 06h, see Section 4.5): bits 15–11, 8
- Secondary status register (PCI offset 16h, see Section 4.14): bits 15–11, 8
- Subsystem vendor ID register (PCI offset 40h, see Section 4.26): bits 15–0
- Subsystem ID register (PCI offset 42h, see Section 4.27): bits 15–0
- PC Card 16-bit I/F legacy-mode base-address register (PCI offset 44h, see Section 4.28): bits 31–0
- System control register (PCI offset 80h, see Section 4.29): bits 31–24, 22–13, 11, 6–0
- MC_CD debounce register (PCI offset 84h, see Section 4.30): bits 7–0
- General control register (PCI offset 86h, see Section 4.31): bits 13–10, 7, 5–3, 1, 0
- General-purpose event status register (PCI offset 88h, see Section 4.32): bits 7, 6, 4–0
- General-purpose event enable register (PCI offset 89h, see Section 4.33): bits 7, 6, 4–0
- General-purpose output register (PCI offset 8Bh, see Section 4.35): bits 4–0
- Multifunction routing register (PCI offset 8Ch, see Section 4.36): bits 31–0
- Retry status register (PCI offset 90h, see Section 4.37): bits 7–5, 3, 1
- Card control register (PCI offset 91h, see Section 4.38): bits 7, 2–0
- Device control register (PCI offset 92h, see Section 4.39): bits 7–5, 3–0
- Diagnostic register (PCI offset 93h, see Section 4.40): bits 7–0
- Power management capabilities register (PCI offset A2h, see Section 4.43): bit 15
- Power management CSR register (PCI offset A4h, see Section 4.44): bits 15, 8
- Serial bus data register (PCI offset B0h, see Section 4.47): bits 7–0
- Serial bus index register (PCI offset B1h, see Section 4.48): bits 7–0
- Serial bus slave address register (PCI offset B2h, see Section 4.49): bits 7–0

- Serial bus control/status register (PCI offset B3h, see Section 4.50): bits 7, 3–0
- ExCA identification and revision register (ExCA 800h/840h, see Section 5.1): bits 7–0
- ExCA global control register (ExCA 81Eh/85Eh, see Section 5.20): bits 2–0
- CardBus socket power management register (CardBus 20h, see Section 6.6): bits 25, 24

The global reset-only (function 3) register bits:

- Subsystem vendor ID register (PCI offset 2Ch, see Section 7.9): bits 15–0
- Subsystem ID register (PCI offset 2Eh, see Section 7.10): bits 15–0
- Power management control and status register (PCI offset 48h, see Section 7.18): bits 15, 8, 1, 0
- General control register (PCI offset 4Ch, see Section 7.21): bits 6–4, 2–0
- Diagnostic register (PCI offset 54h, see Section 7.23): bits 31–0

The global reset-only (function 4) register bits:

- Subsystem vendor ID register (PCI offset 2Ch, see Section 8.9): bits 15–0
- Subsystem ID register (PCI offset 2Eh, see Section 8.10): bits 15–0
- Power management control and status register (PCI offset 84h, see Section 8.19): bits 15, 8, 1, 0
- General control register (PCI offset 88h, see Section 8.22): bits 6–4, 0
- Diagnostic register (PCI offset 90h, see Section 8.24): bits 31–0

The global reset-only (function 5) register bits:

- Subsystem vendor ID register (PCI offset 2Ch, see Section 9.10): bits 15–0
- Subsystem ID register (PCI offset 2Eh, see Section 9.11): bits 15–0
- Power management control and status register (PCI offset 48h, see Section 9.19): bits 15, 8, 1, 0
- General control register (PCI offset 4Ch, see Section 9.22): bits 6–4, 0

4 PC Card Controller Programming Model

This chapter describes the PCI6x21/PCI6x11 PCI configuration registers that make up the 256-byte PCI configuration header for each PCI6x21/PCI6x11 function. There are some bits which affect both CardBus functions, but which, in order to work properly, must be accessed only through function 0. These are called global bits. Registers containing one or more global bits are denoted by § in Table 4–2.

Any bit followed by a † is not cleared by the assertion of $\overline{\text{PRST}}$ (see *CardBus Bridge Power Management*, Section 3.8.9, for more details) if $\overline{\text{PME}}$ is enabled (PCI offset A4h, bit 8). In this case, these bits are cleared only by $\overline{\text{GRST}}$. If $\overline{\text{PME}}$ is not enabled, then these bits are cleared by $\overline{\text{GRST}}$ or $\overline{\text{PRST}}$. These bits are sometimes referred to as PME context bits and are implemented to allow $\overline{\text{PME}}$ context to be preserved during the transition from D3_{hot} or D3_{cold} to D0.

If a bit is followed by a ‡, then this bit is cleared only by $\overline{\text{GRST}}$ in all cases (not conditional on $\overline{\text{PME}}$ being enabled). These bits are intended to maintain device context such as interrupt routing and MFUNC programming during warm resets.

A bit description table, typically included when the register contains bits of more than one type or purpose, indicates bit field names, a detailed field description, and field access tags which appear in the *type* column. Table 4–1 describes the field access tags.

Table 4–1. Bit Field Access Tag Descriptions

ACCESS TAG	NAME	MEANING
R	Read	Field can be read by software.
W	Write	Field can be written by software to any value.
S	Set	Field can be set by a write of 1. Writes of 0 have no effect.
C	Clear	Field can be cleared by a write of 1. Writes of 0 have no effect.
U	Update	Field can be autonomously updated by the PCI6x21/PCI6x11 controller.

4.1 PCI Configuration Register Map (Functions 0 and 1)

The PCI6x21/PCI6x11 is a multifunction PCI device, and the PC Card controller is integrated as PCI functions 0 and 1. The configuration header, compliant with the *PCI Local Bus Specification* as a CardBus bridge header, is *PC99/PC2001* compliant as well. Table 4–2 illustrates the PCI configuration register map, which includes both the predefined portion of the configuration space and the user-definable registers.

Table 4–2. Functions 0 and 1 PCI Configuration Register Map

REGISTER NAME				OFFSET
Device ID		Vendor ID		00h
Status ‡		Command		04h
Class code			Revision ID	08h
BIST	Header type	Latency timer	Cache line size	0Ch
CardBus socket registers/ExCA base address register				10h
Secondary status ‡		Reserved	Capability pointer	14h
CardBus latency timer	Subordinate bus number	CardBus bus number	PCI bus number	18h
CardBus memory base register 0				1Ch
CardBus memory limit register 0				20h
CardBus memory base register 1				24h
CardBus memory limit register 1				28h

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

Table 4–2. Functions 0 and 1 PCI Configuration Register Map (Continued)

REGISTER NAME				OFFSET
CardBus I/O base register 0				2Ch
CardBus I/O limit register 0				30h
CardBus I/O base register 1				34h
CardBus I/O limit register 1				38h
Bridge control †		Interrupt pin	Interrupt line	3Ch
Subsystem ID ‡		Subsystem vendor ID ‡		40h
PC Card 16-bit I/F legacy-mode base-address ‡				44h
Reserved				48h–7Ch
System control †‡§				80h
General control ‡§		Reserved	MC_CD debounce ‡	84h
General-purpose output ‡	General-purpose input	General-purpose event enable ‡	General-purpose event status ‡	88h
Multifunction routing status ‡				8Ch
Diagnostic ‡§	Device control ‡§	Card control ‡§	Retry status ‡§	90h
Reserved				94h–9Ch
Power management capabilities ‡		Next item pointer	Capability ID	A0h
Power management data (Reserved)	Power management control/status bridge support extensions	Power management control/status †‡		A4h
Reserved				A8h–ACh
Serial bus control/status ‡	Serial bus slave address ‡	Serial bus index ‡	Serial bus data ‡	B0h
Reserved				B4h–FCh

† One or more bits in this register are PME context bits and can be cleared only by the assertion of \overline{GRST} when \overline{PME} is enabled. If \overline{PME} is not enabled, then this bit is cleared by the assertion of \overline{PRST} or \overline{GRST} .

‡ One or more bits in this register are cleared only by the assertion of \overline{GRST} .

§ One or more bits in this register are global in nature and must be accessed only through function 0.

4.2 Vendor ID Register

The vendor ID register contains a value allocated by the PCI SIG that identifies the manufacturer of the PCI device. The vendor ID assigned to Texas Instruments is 104Ch.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Vendor ID															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	1	0	0	0	0	0	1	0	0	1	1	0	0

Register: **Vendor ID**
 Offset: 00h (Functions 0, 1)
 Type: Read-only
 Default: 104Ch

4.3 Device ID Register Functions 0 and 1

This read-only register contains the device ID assigned by TI to the PCI6x21/PCI6x11 CardBus controller functions (PCI functions 0 and 1).

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Device ID															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	1	0	0	0	0	0	0	0	0	0	1	1	0	0	0	1

Register: **Device ID**
Offset: 02h (Functions 0 and 1)
Type: Read-only
Default: 8031h

4.4 Command Register

The PCI command register provides control over the PCI6x21/PCI6x11 interface to the PCI bus. All bit functions adhere to the definitions in the *PCI Local Bus Specification* (see Table 4–3). None of the bit functions in this register are shared among the PCI6x21/PCI6x11 PCI functions. Three command registers exist in the PCI6x21/PCI6x11 controller, one for each function. Software manipulates the PCI6x21/PCI6x11 functions as separate entities when enabling functionality through the command register. The SERR_EN and PERR_EN enable bits in this register are internally wired OR between the three functions, and these control bits appear to software to be separate for each function.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Command															
Type	R	R	R	R	R	RW	R	RW	R	RW	RW	R	R	RW	RW	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Command**
 Offset: 04h
 Type: Read-only, Read/Write
 Default: 0000h

Table 4–3. Command Register Description

BIT	SIGNAL	TYPE	FUNCTION
15–11	RSVD	R	Reserved. Bits 15–11 return 0s when read.
10	INT_DISABLE	RW	<u>INTx disable</u> . When set to 1, this bit disables the function from asserting interrupts on the <u>INTx</u> signals. 0 = <u>INTx</u> assertion is enabled (default) 1 = <u>INTx</u> assertion is disabled
9	FBB_EN	R	Fast back-to-back enable. The PCI6x21/PCI6x11 controller does not generate fast back-to-back transactions; therefore, this bit is read-only. This bit returns a 0 when read.
8	SERR_EN	RW	System error (<u>SERR</u>) enable. This bit controls the enable for the <u>SERR</u> driver on the PCI interface. <u>SERR</u> can be asserted after detecting an address parity error on the PCI bus. Both this bit and bit 6 must be set for the PCI6x21/PCI6x11 controller to report address parity errors. 0 = Disables the <u>SERR</u> output driver (default) 1 = Enables the <u>SERR</u> output driver
7	RSVD	R	Reserved. Bit 7 returns 0 when read.
6	PERR_EN	RW	<u>Parity error response enable</u> . This bit controls the PCI6x21/PCI6x11 response to parity errors through the <u>PERR</u> signal. <u>Data</u> parity errors are indicated by asserting <u>PERR</u> , while address parity errors are indicated by asserting <u>SERR</u> . 0 = PCI6x21/PCI6x11 controller ignores detected parity errors (default). 1 = PCI6x21/PCI6x11 controller responds to detected parity errors.
5	VGA_EN	RW	VGA palette snoop. When set to 1, palette snooping is enabled (i.e., the PCI6x21/PCI6x11 controller does not respond to palette register writes and snoops the data). When the bit is 0, the PCI6x21/PCI6x11 controller treats all palette accesses like all other accesses.
4	MWI_EN	R	Memory write-and-invalidate enable. This bit controls whether a PCI initiator device can generate memory write-and-invalidate commands. The PCI6x21/PCI6x11 controller does not support memory write-and-invalidate commands, it uses memory write commands instead; therefore, this bit is hardwired to 0. This bit returns 0 when read. Writes to this bit have no effect.
3	SPECIAL	R	Special cycles. This bit controls whether or not a PCI device ignores PCI special cycles. The PCI6x21/PCI6x11 controller does not respond to special cycle operations; therefore, this bit is hardwired to 0. This bit returns 0 when read. Writes to this bit have no effect.
2	MAST_EN	RW	Bus master control. This bit controls whether or not the PCI6x21/PCI6x11 controller can act as a PCI bus initiator (master). The PCI6x21/PCI6x11 controller can take control of the PCI bus only when this bit is set. 0 = Disables the PCI6x21/PCI6x11 ability to generate PCI bus accesses (default) 1 = Enables the PCI6x21/PCI6x11 ability to generate PCI bus accesses

Table 4–3. Command Register Description (continued)

BIT	SIGNAL	TYPE	FUNCTION
1	MEM_EN	RW	Memory space enable. This bit controls whether or not the PCI6x21/PCI6x11 controller can claim cycles in PCI memory space. 0 = Disables the PCI6x21/PCI6x11 response to memory space accesses (default) 1 = Enables the PCI6x21/PCI6x11 response to memory space accesses
0	IO_EN	RW	I/O space control. This bit controls whether or not the PCI6x21/PCI6x11 controller can claim cycles in PCI I/O space. 0 = Disables the PCI6x21/PCI6x11 controller from responding to I/O space accesses (default) 1 = Enables the PCI6x21/PCI6x11 controller to respond to I/O space accesses

4.5 Status Register

The status register provides device information to the host system. Bits in this register can be read normally. A bit in the status register is reset when a 1 is written to that bit location; a 0 written to a bit location has no effect. All bit functions adhere to the definitions in the *PCI Bus Specification*, as seen in the bit descriptions. PCI bus status is shown through each function. See Table 4–4 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Status															
Type	RW	RW	RW	RW	RW	R	R	RW	R	R	R	R	RU	R	R	R
Default	0	0	0	0	0	0	1	0	0	0	0	1	0	0	0	0

Register: **Status**
 Offset: 06h (Functions 0, 1)
 Type: Read-only, Read/Write
 Default: 0210h

Table 4–4. Status Register Description

BIT	SIGNAL	TYPE	FUNCTION
15 ‡	PAR_ERR	RW	Detected parity error. This bit is set when a parity error is detected, either an address or data parity error. Write a 1 to clear this bit.
14 ‡	SYS_ERR	RW	Signaled system error. This bit is set when \overline{SERR} is enabled and the PCI6x21/PCI6x11 controller signaled a system error to the host. Write a 1 to clear this bit.
13 ‡	MABORT	RW	Received master abort. This bit is set when a cycle initiated by the PCI6x21/PCI6x11 controller on the PCI bus has been terminated by a master abort. Write a 1 to clear this bit.
12 ‡	TABT_REC	RW	Received target abort. This bit is set when a cycle initiated by the PCI6x21/PCI6x11 controller on the PCI bus was terminated by a target abort. Write a 1 to clear this bit.
11 ‡	TABT_SIG	RW	Signaled target abort. This bit is set by the PCI6x21/PCI6x11 controller when it terminates a transaction on the PCI bus with a target abort. Write a 1 to clear this bit.
10–9	PCI_SPEED	R	DEVSEL timing. These bits encode the timing of \overline{DEVSEL} and are hardwired to 01b indicating that the PCI6x21/PCI6x11 controller asserts this signal at a medium speed on nonconfiguration cycle accesses.
8 ‡	DATAPAR	RW	Data parity error detected. Write a 1 to clear this bit. 0 = The conditions for setting this bit have not been met. 1 = A data parity error occurred and the following conditions were met: a. \overline{PERR} was asserted by any PCI device including the PCI6x21/PCI6x11 controller. b. The PCI6x21/PCI6x11 controller was the bus master during the data parity error. c. The parity error response bit is set in the command register.
7	FBB_CAP	R	Fast back-to-back capable. The PCI6x21/PCI6x11 controller cannot accept fast back-to-back transactions; thus, this bit is hardwired to 0.
6	UDF	R	UDF supported. The PCI6x21/PCI6x11 controller does not support user-definable features; therefore, this bit is hardwired to 0.
5	66MHZ	R	66-MHz capable. The PCI6x21/PCI6x11 controller operates at a maximum PCLK frequency of 33 MHz; therefore, this bit is hardwired to 0.

‡ One or more bits in this register are cleared only by the assertion of \overline{GRST} .

Table 4–4. Status Register Description (continued)

BIT	SIGNAL	TYPE	FUNCTION
4	CAPLIST	R	Capabilities list. This bit returns 1 when read. This bit indicates that capabilities in addition to standard PCI capabilities are implemented. The linked list of PCI power-management capabilities is implemented in this function.
3	INT_STATUS	RU	Interrupt status. This bit reflects the interrupt status of the function. Only when bit 10 (INT_DISABLE) in the command register (PCI offset 04h, see Section 4.4) is a 0 and this bit is a 1, is the function's INTx signal asserted. Setting the INT_DISABLE bit to a 1 has no effect on the state of this bit.
2–0	RSVD	R	Reserved. These bits return 0s when read.

4.6 Revision ID Register

The revision ID register indicates the silicon revision of the PCI6x21/PCI6x11 controller.

Bit	7	6	5	4	3	2	1	0
Name	Revision ID							
Type	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0

Register: **Revision ID**
 Offset: 08h (functions 0, 1)
 Type: Read-only
 Default: 00h

4.7 Class Code Register

The class code register recognizes PCI6x21/PCI6x11 functions 0 and 1 as a bridge device (06h) and a CardBus bridge device (07h), with a 00h programming interface.

Bit	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Name	PCI class code																								
	Base class								Subclass								Programming interface								
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	1	1	0	0	0	0	0	0	1	1	1	0	0	0	0	0	0	0	0	

Register: **PCI class code**
 Offset: 09h (functions 0, 1)
 Type: Read-only
 Default: 06 0700h

4.8 Cache Line Size Register

The cache line size register is programmed by host software to indicate the system cache line size.

Bit	7	6	5	4	3	2	1	0
Name	Cache line size							
Type	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0

Register: **Cache line size**
 Offset: 0Ch (Functions 0, 1)
 Type: Read/Write
 Default: 00h

4.9 Latency Timer Register

The latency timer register specifies the latency timer for the PCI6x21/PCI6x11 controller, in units of PCI clock cycles. When the PCI6x21/PCI6x11 controller is a PCI bus initiator and asserts $\overline{\text{FRAME}}$, the latency timer begins counting from zero. If the latency timer expires before the PCI6x21/PCI6x11 transaction has terminated, then the PCI6x21/PCI6x11 controller terminates the transaction when its $\overline{\text{GNT}}$ is deasserted.

Bit	7	6	5	4	3	2	1	0
Name	Latency timer							
Type	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0

Register: **Latency timer**
 Offset: 0Dh
 Type: Read/Write
 Default: 00h

4.10 Header Type Register

The header type register returns 82h when read, indicating that the PCI6x21/PCI6x11 functions 0 and 1 configuration spaces adhere to the CardBus bridge PCI header. The CardBus bridge PCI header ranges from PCI registers 00h–7Fh, and 80h–FFh is user-definable extension registers.

Bit	7	6	5	4	3	2	1	0
Name	Header type							
Type	R	R	R	R	R	R	R	R
Default	1	0	0	0	0	0	1	0

Register: **Header type**
 Offset: 0Eh (Functions 0, 1)
 Type: Read-only
 Default: 82h

4.11 BIST Register

Because the PCI6x21/PCI6x11 controller does not support a built-in self-test (BIST), this register returns the value of 00h when read.

Bit	7	6	5	4	3	2	1	0
Name	BIST							
Type	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0

Register: **BIST**
 Offset: 0Fh (Functions 0, 1)
 Type: Read-only
 Default: 00h

4.12 CardBus Socket Registers/ExCA Base Address Register

This register is programmed with a base address referencing the CardBus socket registers and the memory-mapped ExCA register set. Bits 31–12 are read/write, and allow the base address to be located anywhere in the 32-bit PCI memory address space on a 4-Kbyte boundary. Bits 11–0 are read-only, returning 0s when read. When software writes all 1s to this register, the value read back is FFFF F000h, indicating that at least 4K bytes of memory address space are required. The CardBus registers start at offset 000h, and the memory-mapped ExCA registers begin at offset 800h. This register is not shared by functions 0 and 1, so the system maps each socket control register separately.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	CardBus socket registers/ExCA base address															
Type	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	CardBus socket registers/ExCA base address															
Type	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **CardBus socket registers/ExCA base address**
 Offset: 10h
 Type: Read-only, Read/Write
 Default: 0000 0000h

4.13 Capability Pointer Register

The capability pointer register provides a pointer into the PCI configuration header where the PCI power management register block resides. PCI header doublewords at A0h and A4h provide the power management (PM) registers. Each socket has its own capability pointer register. This register is read-only and returns A0h when read.

Bit	7	6	5	4	3	2	1	0
Name	Capability pointer							
Type	R	R	R	R	R	R	R	R
Default	1	0	1	0	0	0	0	0

Register: **Capability pointer**
 Offset: 14h
 Type: Read-only
 Default: A0h

4.14 Secondary Status Register

The secondary status register is compatible with the PCI-PCI bridge secondary status register. It indicates CardBus-related device information to the host system. This register is very similar to the PCI status register (PCI offset 06h, see Section 4.5), and status bits are cleared by a writing a 1. This register is not shared by the two socket functions, but is accessed on a per-socket basis. See Table 4–5 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Secondary status															
Type	RC	RC	RC	RC	RC	R	R	RC	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0

Register: **Secondary status**
 Offset: 16h
 Type: Read-only, Read/Clear
 Default: 0200h

Table 4–5. Secondary Status Register Description

BIT	SIGNAL	TYPE	FUNCTION
15 ‡	CBPARITY	RC	Detected parity error. This bit is set when a CardBus parity error is detected, either an address or data parity error. Write a 1 to clear this bit.
14 ‡	CBSERR	RC	Signaled system error. This bit is set when $\overline{\text{CSERR}}$ is signaled by a CardBus card. The PCI6x21/PCI6x11 controller does not assert the $\overline{\text{CSERR}}$ signal. Write a 1 to clear this bit.
13 ‡	CBMABORT	RC	Received master abort. This bit is set when a cycle initiated by the PCI6x21/PCI6x11 controller on the CardBus bus is terminated by a master abort. Write a 1 to clear this bit.
12 ‡	REC_CBTA	RC	Received target abort. This bit is set when a cycle initiated by the PCI6x21/PCI6x11 controller on the CardBus bus is terminated by a target abort. Write a 1 to clear this bit.
11 ‡	SIG_CBTA	RC	Signaled target abort. This bit is set by the PCI6x21/PCI6x11 controller when it terminates a transaction on the CardBus bus with a target abort. Write a 1 to clear this bit.
10–9	CB_SPEED	R	CDEVSEL timing. These bits encode the timing of $\overline{\text{CDEVSEL}}$ and are hardwired to 01b indicating that the PCI6x21/PCI6x11 controller asserts this signal at a medium speed.
8 ‡	CB_DPAR	RC	CardBus data parity error detected. Write a 1 to clear this bit. 0 = The conditions for setting this bit have not been met. 1 = A data parity error occurred and the following conditions were met: a. $\overline{\text{CPERR}}$ was asserted on the CardBus interface. b. The PCI6x21/PCI6x11 controller was the bus master during the data parity error. c. The parity error response enable bit (bit 0) is set in the bridge control register (PCI offset 3Eh, see Section 4.25).
7	CBFBB_CAP	R	Fast back-to-back capable. The PCI6x21/PCI6x11 controller cannot accept fast back-to-back transactions; therefore, this bit is hardwired to 0.
6	CB_UDF	R	User-definable feature support. The PCI6x21/PCI6x11 controller does not support user-definable features; therefore, this bit is hardwired to 0.
5	CB66MHZ	R	66-MHz capable. The PCI6x21/PCI6x11 CardBus interface operates at a maximum CCLK frequency of 33 MHz; therefore, this bit is hardwired to 0.
4–0	RSVD	R	These bits return 0s when read.

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

4.15 PCI Bus Number Register

The PCI bus number register is programmed by the host system to indicate the bus number of the PCI bus to which the PCI6x21/PCI6x11 controller is connected. The PCI6x21/PCI6x11 controller uses this register in conjunction with the CardBus bus number and subordinate bus number registers to determine when to forward PCI configuration cycles to its secondary buses.

Bit	7	6	5	4	3	2	1	0
Name	PCI bus number							
Type	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0

Register: **PCI bus number**
 Offset: 18h (Functions 0, 1)
 Type: Read/Write
 Default: 00h

4.16 CardBus Bus Number Register

The CardBus bus number register is programmed by the host system to indicate the bus number of the CardBus bus to which the PCI6x21/PCI6x11 controller is connected. The PCI6x21/PCI6x11 controller uses this register in conjunction with the PCI bus number and subordinate bus number registers to determine when to forward PCI configuration cycles to its secondary buses. This register is separate for each PCI6x21/PCI6x11 controller function.

Bit	7	6	5	4	3	2	1	0
Name	CardBus bus number							
Type	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0

Register: **CardBus bus number**
 Offset: 19h
 Type: Read/Write
 Default: 00h

4.17 Subordinate Bus Number Register

The subordinate bus number register is programmed by the host system to indicate the highest numbered bus below the CardBus bus. The PCI6x21/PCI6x11 controller uses this register in conjunction with the PCI bus number and CardBus bus number registers to determine when to forward PCI configuration cycles to its secondary buses. This register is separate for each CardBus controller function.

Bit	7	6	5	4	3	2	1	0
Name	Subordinate bus number							
Type	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0

Register: **Subordinate bus number**
 Offset: 1Ah
 Type: Read/Write
 Default: 00h

4.18 CardBus Latency Timer Register

The CardBus latency timer register is programmed by the host system to specify the latency timer for the PCI6x21/PCI6x11 CardBus interface, in units of CCLK cycles. When the PCI6x21/PCI6x11 controller is a CardBus initiator and asserts \overline{CFRAME} , the CardBus latency timer begins counting. If the latency timer expires before the PCI6x21/PCI6x11 transaction has terminated, then the PCI6x21/PCI6x11 controller terminates the transaction at the end of the next data phase. A recommended minimum value for this register of 20h allows most transactions to be completed.

Bit	7	6	5	4	3	2	1	0
Name	CardBus latency timer							
Type	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0

Register: **CardBus latency timer**
 Offset: 1Bh (Functions 0, 1)
 Type: Read/Write
 Default: 00h

4.19 CardBus Memory Base Registers 0, 1

These registers indicate the lower address of a PCI memory address range. They are used by the PCI6x21/PCI6x11 controller to determine when to forward a memory transaction to the CardBus bus, and likewise, when to forward a CardBus cycle to PCI. Bits 31–12 of these registers are read/write and allow the memory base to be located anywhere in the 32-bit PCI memory space on 4-Kbyte boundaries. Bits 11–0 are read-only and always return 0s. Writes to these bits have no effect. Bits 8 and 9 of the bridge control register (PCI offset 3Eh, see Section 4.25) specify whether memory windows 0 and 1 are prefetchable or nonprefetchable. The memory base register or the memory limit register must be nonzero in order for the PCI6x21/PCI6x11 controller to claim any memory transactions through CardBus memory windows (i.e., these windows by default are not enabled to pass the first 4 Kbytes of memory to CardBus).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	Memory base registers 0, 1															
Type	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Memory base registers 0, 1															
Type	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Memory base registers 0, 1**
 Offset: 1Ch, 24h
 Type: Read-only, Read/Write
 Default: 0000 0000h

4.20 CardBus Memory Limit Registers 0, 1

These registers indicate the upper address of a PCI memory address range. They are used by the PCI6x21/PCI6x11 controller to determine when to forward a memory transaction to the CardBus bus, and likewise, when to forward a CardBus cycle to PCI. Bits 31–12 of these registers are read/write and allow the memory base to be located anywhere in the 32-bit PCI memory space on 4-Kbyte boundaries. Bits 11–0 are read-only and always return 0s. Writes to these bits have no effect. Bits 8 and 9 of the bridge control register (PCI offset 3Eh, see Section 4.25) specify whether memory windows 0 and 1 are prefetchable or nonprefetchable. The memory base register or the memory limit register must be nonzero in order for the PCI6x21/PCI6x11 controller to claim any memory transactions through CardBus memory windows (i.e., these windows by default are not enabled to pass the first 4 Kbytes of memory to CardBus).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	Memory limit registers 0, 1															
Type	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Memory limit registers 0, 1															
Type	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Memory limit registers 0, 1**
 Offset: 20h, 28h
 Type: Read-only, Read/Write
 Default: 0000 0000h

4.21 CardBus I/O Base Registers 0, 1

These registers indicate the lower address of a PCI I/O address range. They are used by the PCI6x21/PCI6x11 controller to determine when to forward an I/O transaction to the CardBus bus, and likewise, when to forward a CardBus cycle to the PCI bus. The lower 16 bits of this register locate the bottom of the I/O window within a 64-Kbyte page. The upper 16 bits (31–16) are all 0s, which locates this 64-Kbyte page in the first page of the 32-bit PCI I/O address space. Bits 31–2 are read/write and always return 0s forcing I/O windows to be aligned on a natural doubleword boundary in the first 64-Kbyte page of PCI I/O address space. Bits 1–0 are read-only, returning 00 or 01 when read, depending on the value of bit 11 (IO_BASE_SEL) in the general control register (PCI offset 86h, see Section 4.31). These I/O windows are enabled when either the I/O base register or the I/O limit register is nonzero. The I/O windows by default are not enabled to pass the first doubleword of I/O to CardBus.

Either the I/O base register or the I/O limit register must be nonzero to enable any I/O transactions.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	I/O base registers 0, 1															
Type	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	I/O base registers 0, 1															
Type	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	X

Register: **I/O base registers 0, 1**
 Offset: 2Ch, 34h
 Type: Read-only, Read/Write
 Default: 0000 000Xh

4.22 CardBus I/O Limit Registers 0, 1

These registers indicate the upper address of a PCI I/O address range. They are used by the PCI6x21/PCI6x11 controller to determine when to forward an I/O transaction to the CardBus bus, and likewise, when to forward a CardBus cycle to PCI. The lower 16 bits of this register locate the top of the I/O window within a 64-Kbyte page, and the upper 16 bits are a page register which locates this 64-Kbyte page in 32-bit PCI I/O address space. Bits 15–2 are read/write and allow the I/O limit address to be located anywhere in the 64-Kbyte page (indicated by bits 31–16 of the appropriate I/O base register) on doubleword boundaries.

Bits 31–16 are read-only and always return 0s when read. The page is set in the I/O base register. Bits 15–2 are read/write and bits 1–0 are read-only, returning 00 or 01 when read, depending on the value of bit 12 (IO_LIMIT_SEL) in the general control register (PCI offset 86h, see Section 4.31). Writes to read-only bits have no effect.

These I/O windows are enabled when either the I/O base register or the I/O limit register is nonzero. By default, the I/O windows are not enabled to pass the first doubleword of I/O to CardBus.

Either the I/O base register or the I/O limit register must be nonzero to enable any I/O transactions.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	I/O limit registers 0, 1															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	I/O limit registers 0, 1															
Type	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	X

Register: **I/O limit registers 0, 1**
 Offset: 30h, 38h
 Type: Read-only, Read/Write
 Default: 0000 000Xh

4.23 Interrupt Line Register

The interrupt line register is a read/write register used by the host software. As part of the interrupt routing procedure, the host software writes this register with the value of the system IRQ assigned to the function.

Bit	7	6	5	4	3	2	1	0
Name	Interrupt line							
Type	RW	RW	RW	RW	RW	RW	RW	RW
Default	1	1	1	1	1	1	1	1

Register: **Interrupt line**
 Offset: 3Ch
 Type: Read/Write
 Default: FFh

4.24 Interrupt Pin Register

The value read from this register is function dependent. The default value for function 0 is 01h ($\overline{\text{INTA}}$), and the default value for function 1 is 02h ($\overline{\text{INTB}}$), the default value for function 2 is 03h ($\overline{\text{INTC}}$), and the default value for function 3 is 04h ($\overline{\text{INTD}}$). The value also depends on the values of bits 28, the tie-all bit (TIEALL), and 29, the interrupt tie bit (INTRTIE), in the system control register (PCI offset 80h, see Section 4.29). The INTRTIE bit is compatible with previous TI CardBus controllers, and when set to 1, ties $\overline{\text{INTB}}$ to $\overline{\text{INTA}}$ internally. The TIEALL bit ties $\overline{\text{INTA}}$, $\overline{\text{INTB}}$, $\overline{\text{INTC}}$, and $\overline{\text{INTD}}$ together internally. The internal interrupt connections set by INTRTIE and TIEALL are communicated to host software through this standard register interface. This read-only register is described for all PCI6x21/PCI6x11 functions in Table 4–6.

PCI function 0

Bit	7	6	5	4	3	2	1	0
Name	Interrupt pin – PCI function 0							
Type	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	1

PCI function 1

Bit	7	6	5	4	3	2	1	0
Name	Interrupt pin – PCI function 1							
Type	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	1	0

PCI function 3

Bit	7	6	5	4	3	2	1	0
Name	Interrupt pin – PCI function 3							
Type	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	X	X	X

PCI function 4

Bit	7	6	5	4	3	2	1	0
Name	Interrupt pin – PCI function 4							
Type	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	X	X	X

PCI function 5

Bit	7	6	5	4	3	2	1	0
Name	Interrupt pin – PCI function 5							
Type	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	X	X	X

Register: **Interrupt pin**
 Offset: 3Dh
 Type: Read-only
 Default: 01h (function 0), 02h (function 1), 04h (function 3), 04h (function 4), 04h (function 5)

Table 4–6. Interrupt Pin Register Cross Reference

INTRTIE BIT (BIT 29, OFFSET 80h)	TIEALL BIT (BIT 28, OFFSET 80h)	INTPIN FUNCTION 0 (CARDBUS)	INTPIN FUNCTION 1 (CARDBUS)	INTPIN FUNCTION 3 (FLASH MEDIA)	INTPIN Function 4 (SD Host)	INTPIN Function 5 (Smart Card)
0	0	01h ($\overline{\text{INTA}}$)	02h ($\overline{\text{INTB}}$)	Determined by bits 6–5 (INT_SEL field) in flash media general control register (see Section 7.21)	Determined by bits 6–5 (INT_SEL field) in SD host general control register (see Section 8.22)	Determined by bits 6–5 (INT_SEL field) in Smart Card general control register (see Section 9.22)
1	0	01h ($\overline{\text{INTA}}$)	01h ($\overline{\text{INTA}}$)			
X	1	01h ($\overline{\text{INTA}}$)	01h ($\overline{\text{INTA}}$)	01h ($\overline{\text{INTA}}$)	0x01 ($\overline{\text{INTA}}$)	0x01 ($\overline{\text{INTA}}$)

4.25 Bridge Control Register

The bridge control register provides control over various PCI6x21/PCI6x11 bridging functions. Some bits in this register are global in nature and must be accessed only through function 0. See Table 4–7 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Bridge control															
Type	R	R	R	R	R	RW	RW	RW	RW	RW	RW	R	RW	RW	RW	RW
Default	0	0	0	0	0	0	1	1	0	1	0	0	0	0	0	0

Register: **Bridge control**
 Offset: 3Eh (Function 0, 1)
 Type: Read-only, Read/Write
 Default: 0340h

Table 4–7. Bridge Control Register Description

BIT	SIGNAL	TYPE	FUNCTION
15–11	RSVD	R	These bits return 0s when read.
10	POSTEN	RW	Write posting enable. Enables write posting to and from the CardBus sockets. Write posting enables the posting of write data on burst cycles. Operating with write posting disabled impairs performance on burst cycles. Note that burst write data can be posted, but various write transactions may not. This bit is socket dependent and is not shared between functions 0 and 1.
9	PREFETCH1	RW	Memory window 1 type. This bit specifies whether or not memory window 1 is prefetchable. This bit is socket dependent. This bit is encoded as: 0 = Memory window 1 is nonprefetchable. 1 = Memory window 1 is prefetchable (default).
8	PREFETCH0	RW	Memory window 0 type. This bit specifies whether or not memory window 0 is prefetchable. This bit is socket dependent. This bit is encoded as: 0 = Memory window 0 is nonprefetchable. 1 = Memory window 0 is prefetchable (default).
7	INTR	RW	PCI interrupt – IREQ routing enable. This bit is used to select whether PC Card functional interrupts are routed to PCI interrupts or to the IRQ specified in the ExCA registers. 0 = Functional interrupts are routed to PCI interrupts (default). 1 = Functional interrupts are routed by ExCA registers.
6 †	CRST	RW	CardBus reset. When this bit is set, the $\overline{\text{CRST}}$ signal is asserted on the CardBus interface. The $\overline{\text{CRST}}$ signal can also be asserted by passing a $\overline{\text{PRST}}$ assertion to CardBus. 0 = $\overline{\text{CRST}}$ is deasserted. 1 = $\overline{\text{CRST}}$ is asserted (default). This bit is not cleared by the assertion of $\overline{\text{PRST}}$. It is only cleared by the assertion of $\overline{\text{GRST}}$.

† One or more bits in this register are PME context bits and can be cleared only by the assertion of $\overline{\text{GRST}}$ when $\overline{\text{PME}}$ is enabled. If $\overline{\text{PME}}$ is not enabled, then this bit is cleared by the assertion of $\overline{\text{PRST}}$ or $\overline{\text{GRST}}$.

Table 4–7. Bridge Control Register Description (Continued)

BIT	SIGNAL	TYPE	FUNCTION
5	MABTMODE	RW	Master abort mode. This bit controls how the PCI6x21/PCI6x11 controller responds to a master abort when the PCI6x21/PCI6x11 controller is an initiator on the CardBus interface. This bit is common between each socket. 0 = Master aborts not reported (default). 1 = Signal target abort on PCI and signal $\overline{\text{SERR}}$, if enabled.
4	RSVD	R	This bit returns 0 when read.
3	VGAEN	RW	VGA enable. This bit affects how the PCI6x21/PCI6x11 controller responds to VGA addresses. When this bit is set, accesses to VGA addresses are forwarded.
2	ISAEN	RW	ISA mode enable. This bit affects how the PCI6x21/PCI6x11 controller passes I/O cycles within the 64-Kbyte ISA range. This bit is not common between sockets. When this bit is set, the PCI6x21/PCI6x11 controller does not forward the last 768 bytes of each 1K I/O range to CardBus.
1	CSERREN	RW	$\overline{\text{CSERR}}$ enable. This bit controls the response of the PCI6x21/PCI6x11 controller to $\overline{\text{CSERR}}$ signals on the CardBus bus. This bit is separate for each socket. 0 = $\overline{\text{CSERR}}$ is not forwarded to PCI $\overline{\text{SERR}}$ (default) 1 = $\overline{\text{CSERR}}$ is forwarded to PCI $\overline{\text{SERR}}$.
0	CPERREN	RW	CardBus parity error response enable. This bit controls the response of the PCI6x21/PCI6x11 to CardBus parity errors. This bit is separate for each socket. 0 = CardBus parity errors are ignored (default). 1 = CardBus parity errors are reported using $\overline{\text{CPERR}}$.

4.26 Subsystem Vendor ID Register

The subsystem vendor ID register, used for system and option card identification purposes, may be required for certain operating systems. This register is read-only or read/write, depending on the setting of bit 5 (SUBSYSRW) in the system control register (PCI offset 80h, See Section 4.29). When bit 5 is 0, this register is read/write; when bit 5 is 1, this register is read-only. The default mode is read-only. All bits in this register are reset by $\overline{\text{GRST}}$ only.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Subsystem vendor ID															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Subsystem vendor ID**
 Offset: 40h (Functions 0, 1)
 Type: Read-only, (Read/Write when bit 5 in the system control register is 0)
 Default: 0000h

4.27 Subsystem ID Register

The subsystem ID register, used for system and option card identification purposes, may be required for certain operating systems. This register is read-only or read/write, depending on the setting of bit 5 (SUBSYSRW) in the system control register (PCI offset 80h, see Section 4.29). When bit 5 is 0, this register is read/write; when bit 5 is 1, this register is read-only. The default mode is read-only. All bits in this register are reset by $\overline{\text{GRST}}$ only.

If an EEPROM is present, then the subsystem ID and subsystem vendor ID is loaded from the EEPROM after a reset.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Subsystem ID															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Subsystem ID**
 Offset: 42h (Functions 0, 1)
 Type: Read-only, (Read/Write when bit 5 in the system control register is 0)
 Default: 0000h

4.28 PC Card 16-Bit I/F Legacy-Mode Base-Address Register

The PCI6x21/PCI6x11 controller supports the index/data scheme of accessing the ExCA registers, which is mapped by this register. An address written to this register is the address for the index register and the address+1 is the data address. Using this access method, applications requiring index/data ExCA access can be supported. The base address can be mapped anywhere in 32-bit I/O space on a word boundary; hence, bit 0 is read-only, returning 1 when read. As specified in the *PCI to PCMCIA CardBus Bridge Register Description* specification, this register is shared by functions 0 and 1. See the ExCA register set description in Section 5 for register offsets. All bits in this register are reset by $\overline{\text{GRST}}$ only.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	PC Card 16-bit I/F legacy-mode base-address															
Type	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	PC Card 16-bit I/F legacy-mode base-address															
Type	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Register: **PC Card 16-bit I/F legacy-mode base-address**
 Offset: 44h (Functions 0, 1)
 Type: Read-only, Read/Write
 Default: 0000 0001h

4.29 System Control Register

System-level initializations are performed through programming this doubleword register. Some of the bits are global in nature and must be accessed only through function 0. See Table 4–8 for a complete description of the register contents.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	System control															
Type	RW	RW	RW	RW	RW	RW	RW	RW	R	RW	RW	RW	R	R	R	R
Default	0	0	0	0	1	0	0	0	0	1	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	System control															
Type	RW	RW	R	R	R	R	R	R	R	RW	RW	RW	RW	R	RW	RW
Default	1	0	0	1	0	0	0	0	0	1	1	0	0	0	0	0

Register: **System control**
 Offset: 80h (Functions 0, 1)
 Type: Read-only, Read/Write
 Default: 0840 9060h

Table 4–8. System Control Register Description

BIT	SIGNAL	TYPE	FUNCTION
31–30 ‡§	SER_STEP	RW	Serial input stepping. In serial PCI interrupt mode, these bits are used to configure the serial stream PCI interrupt frames, and can be used to accomplish an even distribution of interrupts signaled on the four PCI interrupt slots. 00 = $\overline{\text{INTA}}/\overline{\text{INTB}}/\overline{\text{INTC}}/\overline{\text{INTD}}$ signal in $\overline{\text{INTA}}/\overline{\text{INTB}}/\overline{\text{INTC}}/\overline{\text{INTD}}$ slots (default) 01 = $\overline{\text{INTA}}/\overline{\text{INTB}}/\overline{\text{INTC}}/\overline{\text{INTD}}$ signal in $\overline{\text{INTB}}/\overline{\text{INTC}}/\overline{\text{INTD}}/\overline{\text{INTA}}$ slots 10 = $\overline{\text{INTA}}/\overline{\text{INTB}}/\overline{\text{INTC}}/\overline{\text{INTD}}$ signal in $\overline{\text{INTC}}/\overline{\text{INTD}}/\overline{\text{INTA}}/\overline{\text{INTB}}$ slots 11 = $\overline{\text{INTA}}/\overline{\text{INTB}}/\overline{\text{INTC}}/\overline{\text{INTD}}$ signal in $\overline{\text{INTD}}/\overline{\text{INTA}}/\overline{\text{INTB}}/\overline{\text{INTC}}$ slots
29 ‡§	INTRTIE	RW	This bit ties $\overline{\text{INTA}}$ to $\overline{\text{INTB}}$ internally (to $\overline{\text{INTA}}$), and reports this through the interrupt pin register (PCI offset 3Dh, see Section 4.24). This bit has no effect on $\overline{\text{INTC}}$ or $\overline{\text{INTD}}$.
28 ‡	TIEALL	RW	This bit ties $\overline{\text{INTA}}$, $\overline{\text{INTB}}$, $\overline{\text{INTC}}$, and $\overline{\text{INTD}}$ internally (to $\overline{\text{INTA}}$), and reports this through the interrupt pin register (PCI offset 3Dh, see Section 4.24).
27 ‡	PSCCLK	RW	P2C power switch clock. The PCI6x21/PCI6x11 CLOCK signal clocks the serial interface power switch and the internal state machine. The default state for this bit is 0, requiring an external clock source provided to the CLOCK terminal. Bit 27 can be set to 1, allowing the internal oscillator to provide the clock signal. 0 = CLOCK is provided externally, input to the PCI6x21/PCI6x11 controller. 1 = CLOCK is generated by the internal oscillator and driven by the PCI6x21/PCI6x11 controller. (default)
26 ‡§	SMIRROUTE	RW	SMI interrupt routing. This bit is shared between functions 0 and 1, and selects whether IRQ2 or CSC is signaled when a write occurs to power a PC Card socket. 0 = PC Card power change interrupts are routed to IRQ2 (default). 1 = A CSC interrupt is generated on PC Card power changes.
25 ‡	SMISTATUS	RW	SMI interrupt status. This socket-dependent bit is set when a write occurs to set the socket power, and the SMIENB bit is set. Writing a 1 to this bit clears the status. 0 = SMI interrupt is signaled. 1 = SMI interrupt is not signaled.
24 ‡§	SMIENB	RW	SMI interrupt mode enable. When this bit is set, the SMI interrupt signaling generates an interrupt when a write to the socket power control occurs. This bit is shared and defaults to 0 (disabled). 0 = SMI interrupt mode is disabled (default). 1 = SMI interrupt mode is enabled.
23	RSVD	R	Reserved

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

§ These bits are global in nature and must be accessed only through function 0.

Table 4–8. System Control Register Description (continued)

BIT	SIGNAL	TYPE	FUNCTION
22 ‡	CBRSVD	RW	CardBus reserved terminals signaling. When this bit is set, the RSVD CardBus terminals are driven low when a CardBus card has been inserted. When this bit is low, these signals are placed in a high-impedance state. 0 = Place the CardBus RSVD terminals in a high-impedance state. 1 = Drive the CardBus RSVD terminals low (default).
21 ‡	VCCPROT	RW	V _{CC} protection enable. This bit is socket dependent. 0 = V _{CC} protection is enabled for 16-bit cards (default). 1 = V _{CC} protection is disabled for 16-bit cards.
20–16 ‡	RSVD	RW	These bits are reserved. Do not change the value of these bits.
15 ‡§	MRBURSTDN	RW	Memory read burst enable downstream. When this bit is set, the PCI6x21/PCI6x11 controller allows memory read transactions to burst downstream. 0 = MRBURSTDN downstream is disabled. 1 = MRBURSTDN downstream is enabled (default).
14 ‡§	MRBURSTUP	RW	Memory read burst enable upstream. When this bit is set, the PCI6x21/PCI6x11 controller allows memory read transactions to burst upstream. 0 = MRBURSTUP upstream is disabled (default). 1 = MRBURSTUP upstream is enabled.
13 ‡	SOCACTIVE	R	Socket activity status. When set, this bit indicates access has been performed to or from a PC Card. Reading this bit causes it to be cleared. This bit is socket dependent. 0 = No socket activity (default) 1 = Socket activity
12	RSVD	R	Reserved. This bit returns 1 when read.
11 ‡	PWRSTREAM	R	Power-stream-in-progress status bit. When set, this bit indicates that a power stream to the power switch is in progress and a powering change has been requested. When this bit is cleared, it indicates that the power stream is complete. 0 = Power stream is complete, delay has expired (default). 1 = Power stream is in progress.
10 †	DELAYUP	R	Power-up delay-in-progress status bit. When set, this bit indicates that a power-up stream has been sent to the power switch, and proper power may not yet be stable. This bit is cleared when the power-up delay has expired. 0 = Power-up delay has expired (default). 1 = Power-up stream sent to switch. Power might not be stable.
9 †	DELAYDOWN	R	Power-down delay-in-progress status bit. When set, this bit indicates that a power-down stream has been sent to the power switch, and proper power may not yet be stable. This bit is cleared when the power-down delay has expired. 0 = Power-down delay has expired (default). 1 = Power-down stream sent to switch. Power might not be stable.
8 †	INTERROGATE	R	Interrogation in progress. When set, this bit indicates an interrogation is in progress, and clears when the interrogation completes. This bit is socket-dependent. 0 = Interrogation not in progress (default) 1 = Interrogation in progress
7	RSVD	R	Reserved. This bit returns 0 when read.
6 ‡§	PWRSAVINGS	RW	Power savings mode enable. When this bit is set, the PCI6x21/PCI6x11 controller consumes less power with no performance loss. This bit is shared between the two PCI6x21/PCI6x11 CardBus functions. 0 = Power savings mode disabled 1 = Power savings mode enabled (default)
5 ‡§	SUBSYSRW	RW	Subsystem ID and subsystem vendor ID, ExCA ID and revision register read/write enable. This bit also controls read/write for the function 3 subsystem ID register. 0 = Registers are read/write. 1 = Registers are read-only (default).

† One or more bits in this register are PME context bits and can be cleared only by the assertion of \overline{GRST} when \overline{PME} is enabled. If \overline{PME} is not enabled, then this bit is cleared by the assertion of \overline{PRST} or \overline{GRST} .

‡ One or more bits in this register are cleared only by the assertion of \overline{GRST} .

§ These bits are global in nature and must be accessed only through function 0.

Table 4–8. System Control Register Description (continued)

BIT	SIGNAL	TYPE	FUNCTION
4 ‡§	CB_DPAR	RW	CardBus data parity SERR signaling enable. 0 = CardBus data parity not signaled on $\overline{\text{PCI_SERR}}$ signal (default) 1 = CardBus data parity signaled on PCI SERR signal
3 ‡§	RSVD	R	Reserved. This bit returns 0 when read.
2 ‡	EXCAPOWER	R	ExCA power control bit. 0 = Enables 3.3 V (default) 1 = Enables 5 V
1 ‡§	KEEPCLK	RW	Keep clock. When this bit is set, the PCI6x21/PCI6x11 controller follows the $\overline{\text{CLKRUN}}$ protocol to maintain the system PCLK and the CCLK (CardBus clock). This bit is global to the PCI6x21/PCI6x11 functions. 0 = Allow system PCLK and CCLK clocks to stop (default) 1 = Never allow system PCLK or CCLK clock to stop Note that the functionality of this bit has changed relative to that of the PCI12XX family of TI CardBus controllers. In these CardBus controllers, setting this bit only maintains the PCI clock, not the CCLK. In the PCI6x21/PCI6x11 controller, setting this bit maintains both the PCI clock and the CCLK.
0 ‡§	RIMUX	RW	$\overline{\text{PME/RI_OUT}}$ select bit. When this bit is 1, the PME signal is routed to the $\overline{\text{PME/RI_OUT}}$ terminal (R03). When this bit is 0 and bit 7 (RIENB) of the card control register is 1, the $\overline{\text{RI_OUT}}$ signal is routed to the $\overline{\text{PME/RI_OUT}}$ terminal. If this bit is 0 and bit 7 (RIENB) of the card control register is 0, then the output is placed in a high-impedance state. This terminal is encoded as: 0 = $\overline{\text{RI_OUT}}$ signal is routed to the $\overline{\text{PME/RI_OUT}}$ terminal if bit 7 of the card control register is 1. (default) 1 = $\overline{\text{PME}}$ signal is routed to the $\overline{\text{PME/RI_OUT}}$ terminal of the PCI6x21/PCI6x11 controller. NOTE: If this bit (bit 0) is 0 and bit 7 of the card control register (PCI offset 91h, see Section 4.38) is 0, then the output on the $\overline{\text{PME/RI_OUT}}$ terminal is placed in a high-impedance state.

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

§ These bits are global in nature and must be accessed only through function 0.

4.30 MC_CD Debounce Register

This register provides debounce time in units of 2 ms for the $\overline{\text{MC_CD}}$ signal on UltraMedia cards. This register defaults to 19h, which gives a default debounce time of 50 ms. All bits in this register are reset by $\overline{\text{GRST}}$ only.

Bit	7	6	5	4	3	2	1	0
Name	MC_CD debounce							
Type	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	1	1	0	0	1

Register: **MC_CD debounce**
 Offset: 84h (Functions 0, 1)
 Type: Read/Write
 Default: 19h

4.31 General Control Register

The general control register provides top level PCI arbitration control. It also provides the ability to disable the 1394 OHCI function and provides control over miscellaneous new functionality. See Table 4–9 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	General control															
Type	R	R	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	R	RW	RW
Default	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0

Register: **General control**
 Offset: 86h
 Type: Read/Write, Read-only
 Default: 0080h

Table 4–9. General Control Register Description

BIT	SIGNAL	TYPE	FUNCTION
15 ‡	FM_PWR_CTRL_POL	RW	Flash media power control pin polarity. This bit controls the polarity of the MC_PWR_CTRL_0 and MC_PWR_CTRL_1 terminals. 0 = MC_PWR_CTRL_x terminals are active low (default) 1 = MC_PWR_CTRL_x terminals are active high
14 ‡	SC_IF_SEL	RWU	Smart Card interface select. This bit controls the selection of the dedicated Smart Card interface used by the controller. 0 = EMV interface selected (default) 1 = PCI7x10-style interface selected Note: The PCI7x10-style interface is only allowed when bits 9–8 (FM_IF_SEL field) are 01. If bits 9–8 contain any other value, then this bit is 0. Care must be taken in the design to ensure that this bit can be set to 1 at the same time that bits 9–8 are set to 01.
13 ‡	SIM_MODE	RW	When this bit is set, it reduces the query time for UltraMedia card types. 0 = Query time is unaffected (default) 1 = Query time is reduced for simulation purposes
12 ‡	IO_LIMIT_SEL	RW	When this bit is set, bit 0 in the I/O limit registers (PCI offsets 30h and 38h) for both CardBus functions is set. 0 = Bit 0 in the I/O limit registers is 0 (default) 1 = Bit 0 in the I/O limit registers is 1
11 ‡	IO_BASE_SEL	RW	When this bit is set, bit 0 in the I/O base registers (PCI offsets 2Ch and 34h) for both CardBus functions is set. 0 = Bit 0 in the I/O base registers is 0 (default) 1 = Bit 0 in the I/O base registers is 1
10 ‡	12V_SW_SEL	RW	Power switch select. This bit selects which power switch is implemented in the system. 0 = A 1.8-V capable power switch (TPS2228) is used (default) 1 = A 12-V capable power switch (TPS2226) is used
9–8 ‡	FM_IF_SEL	RW	Dedicated flash media interface selection. This field controls the mode of the dedicated flash media interface. 00 = Flash media interface configured as SD/MMC socket + MS socket (default) 01 = Flash media interface configured as 2-in-1 (SD/MMC, MS) socket 10 = Flash media interface configured as 3-in-1 (SD/MMC, MS, SM/XD) socket 11 = Reserved
7 ‡	DISABLE_SC	RW	When this bit is set, the Smart Card function is completely nonaccessible and nonfunctional.
6 ‡	DISABLE_SD	RW	When this bit is set, the SD host controller function is completely nonaccessible and nonfunctional.
5 ‡	DISABLE_FM	RW	When this bit is set, the flash media function is completely nonaccessible and nonfunctional.
4 ‡	DISABLE_SKTB	RW	When this bit is set, CardBus socket B (function 1) is completely nonaccessible and nonfunctional.
3 ‡	DISABLE_OHCI	RW	When this bit is set, the OHCI 1394 controller function is completely nonaccessible and nonfunctional.

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

Table 4–9. General Control Register Description (Continued)

BIT	SIGNAL	TYPE	FUNCTION
2 ‡	DED_SC_PWR_CTRL	RW	Dedicated Smart Card power control. This bit determines how power to the dedicated Smart Card socket is controlled. 0 = Controlled through the SC_PWR_CTRL terminal (default) 1 = Controlled through the VPP voltage of socket B of the CardBus power switch (the design must ensure that this mode can only be set when CardBus socket B is disabled).
1–0 ‡	ARB_CTRL	RW	Controls top level PCI arbitration: 00 = 1394 OHCI priority 10 = Flash media/SD host priority 01 = CardBus priority 11 = Fair round robin Note: When flash media/SD host priority is selected, there must be a two-level priority scheme with the first level being a round robin between the flash media and SD host functions and the second level being a round robin between the CardBus and 1394 functions.

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

4.32 General-Purpose Event Status Register

The general-purpose event status register contains status bits that are set when general events occur, and can be programmed to generate general-purpose event signaling through $\overline{\text{GPE}}$. See Table 4–10 for a complete description of the register contents.

Bit	7	6	5	4	3	2	1	0
Name	General-purpose event status							
Type	RCU	RCU	R	RCU	RCU	RCU	RCU	RCU
Default	0	0	0	0	0	0	0	0

Register: **General-purpose event status**
 Offset: 88h
 Type: Read/Clear/Update, Read-only
 Default: 00h

Table 4–10. General-Purpose Event Status Register Description

BIT	SIGNAL	TYPE	FUNCTION
7 ‡	PWR_STS	RCU	Power change status. This bit is set when software changes the V_{CC} or V_{PP} power state of either socket.
6 ‡	VPP12_STS	RCU	12-V V_{PP} request status. This bit is set when software has changed the requested V_{PP} level to or from 12 V for either socket.
5	RSVD	R	Reserved. This bit returns 0 when read. A write has no effect.
4 ‡	GP4_STS	RCU	GPI4 status. This bit is set on a change in status of the MFUNC5 terminal input level if configured as a general-purpose input, GPI4.
3 ‡	GP3_STS	RCU	GPI3 status. This bit is set on a change in status of the MFUNC4 terminal input level if configured as a general-purpose input, GPI3.
2 ‡	GP2_STS	RCU	GPI2 status. This bit is set on a change in status of the MFUNC2 terminal input level if configured as a general-purpose input, GPI2.
1 ‡	GP1_STS	RCU	GPI1 status. This bit is set on a change in status of the MFUNC1 terminal input level if configured as a general-purpose input, GPI1.
0 ‡	GP0_STS	RCU	GPI0 status. This bit is set on a change in status of the MFUNC0 terminal input level if configured as a general-purpose input, GPI0.

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

4.33 General-Purpose Event Enable Register

The general-purpose event enable register contains bits that are set to enable $\overline{\text{GPE}}$ signals. See Table 4–11 for a complete description of the register contents.

Bit	7	6	5	4	3	2	1	0
Name	General-purpose event enable							
Type	RW	RW	R	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0

Register: **General-purpose event enable**
 Offset: 89h
 Type: Read-only, Read/Write
 Default: 00h

Table 4–11. General-Purpose Event Enable Register Description

BIT	SIGNAL	TYPE	FUNCTION
7 ‡	PWR_EN	RW	Power change $\overline{\text{GPE}}$ enable. When this bit is set, $\overline{\text{GPE}}$ is signaled on PWR_STS events.
6 ‡	VPP12_EN	RW	12-V V_{PP} $\overline{\text{GPE}}$ enable. When this bit is set, $\overline{\text{GPE}}$ is signaled on VPP12_STS events.
5	RSVD	R	Reserved. This bit returns 0 when read. A write has no effect.
4 ‡	GP4_EN	RW	GPI4 $\overline{\text{GPE}}$ enable. When this bit is set, $\overline{\text{GPE}}$ is signaled on GP4_STS events.
3 ‡	GP3_EN	RW	GPI3 $\overline{\text{GPE}}$ enable. When this bit is set, $\overline{\text{GPE}}$ is signaled on GP3_STS events.
2 ‡	GP2_EN	RW	GPI2 $\overline{\text{GPE}}$ enable. When this bit is set, $\overline{\text{GPE}}$ is signaled on GP2_STS events.
1 ‡	GP1_EN	RW	GPI1 $\overline{\text{GPE}}$ enable. When this bit is set, $\overline{\text{GPE}}$ is signaled on GP1_STS events.
0 ‡	GP0_EN	RW	GPI0 $\overline{\text{GPE}}$ enable. When this bit is set, $\overline{\text{GPE}}$ is signaled on GP0_STS events.

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

4.34 General-Purpose Input Register

The general-purpose input register contains the logical value of the data input to the GPI terminals. See Table 4–12 for a complete description of the register contents.

Bit	7	6	5	4	3	2	1	0
Name	General-purpose input							
Type	R	R	R	RU	RU	RU	RU	RU
Default	0	0	0	X	X	X	X	X

Register: **General-purpose input**
 Offset: 8Ah
 Type: Read/Update, Read-only
 Default: XXh

Table 4–12. General-Purpose Input Register Description

BIT	SIGNAL	TYPE	FUNCTION
7–5	RSVD	R	Reserved. These bits return 0s when read. Writes have no effect.
4	GPI4_DATA	RU	GPI4 data input. This bit represents the logical value of the data input from GPI4.
3	GPI3_DATA	RU	GPI3 data input. This bit represents the logical value of the data input from GPI3.
2	GPI2_DATA	RU	GPI2 data input. This bit represents the logical value of the data input from GPI2.
1	GPI1_DATA	RU	GPI1 data input. This bit represents the logical value of the data input from GPI1.
0	GPI0_DATA	RU	GPI0 data input. This bit represents the logical value of the data input from GPI0.

4.35 General-Purpose Output Register

The general-purpose output register is used to drive the GPO4–GPO0 outputs. See Table 4–13 for a complete description of the register contents.

Bit	7	6	5	4	3	2	1	0
Name	General-purpose output							
Type	R	R	R	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0

Register: **General-purpose output**
 Offset: 8Bh
 Type: Read-only, Read/Write
 Default: 00h

Table 4–13. General-Purpose Output Register Description

BIT	SIGNAL	TYPE	FUNCTION
7–5	RSVD	R	Reserved. These bits return 0s when read. Writes have no effect.
4 ‡	GPO4_DATA	RW	This bit represents the logical value of the data driven to GPO4.
3 ‡	GPO3_DATA	RW	This bit represents the logical value of the data driven to GPO3.
2 ‡	GPO2_DATA	RW	This bit represents the logical value of the data driven to GPO2.
1 ‡	GPO1_DATA	RW	This bit represents the logical value of the data driven to GPO1.
0 ‡	GPO0_DATA	RW	This bit represents the logical value of the data driven to GPO0.

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

4.36 Multifunction Routing Status Register

The multifunction routing status register is used to configure the MFUNC6–MFUNC0 terminals. These terminals may be configured for various functions. This register is intended to be programmed once at power-on initialization. The default value for this register can also be loaded through a serial EEPROM. See Table 4–14 for a complete description of the register contents.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	Multifunction routing status															
Type	R	RW	RW	RW	R	RW	RW	RW	R	RW	RW	RW	R	RW	RW	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Multifunction routing status															
Type	R	RW	RW	RW	R	RW	RW	RW	R	RW	RW	RW	R	RW	RW	RW
Default	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Multifunction routing status**
 Offset: 8Ch
 Type: Read/Write, Read-only
 Default: 0000 1000h

Table 4–14. Multifunction Routing Status Register Description

BIT	SIGNAL	TYPE	FUNCTION
31–28 ‡	RSVD	R	Bits 31–28 return 0s when read.
27–24 ‡	MFUNC6	RW	Multifunction terminal 6 configuration. These bits control the internal signal mapped to the MFUNC6 terminal as follows: 0000 = <u>RSVD</u> 0100 = IRQ4 1000 = IRQ8 1100 = IRQ12 0001 = <u>CLKRUN</u> 0101 = IRQ5 1001 = IRQ9 1101 = IRQ13 0010 = <u>IRQ2</u> 0110 = IRQ6 1010 = IRQ10 1110 = IRQ14 0011 = <u>IRQ3</u> 0111 = IRQ7 1011 = IRQ11 1111 = IRQ15
23–20 ‡	MFUNC5	RW	Multifunction terminal 5 configuration. These bits control the internal signal mapped to the MFUNC5 terminal as follows: 0000 = <u>GPI4</u> 0100 = <u>SC_DBG_RX</u> 1000 = <u>CAUDPWM</u> 1100 = <u>LEDA1</u> 0001 = <u>GPO4</u> 0101 = <u>IRQ5</u> 1001 = <u>IRQ9</u> 1101 = <u>LED_SKT</u> 0010 = <u>PCGNT</u> 0110 = <u>RSVD</u> 1010 = <u>FM_LED</u> 1110 = <u>GPE</u> 0011 = <u>IRQ3</u> 0111 = <u>RSVD</u> 1011 = <u>OHCI_LED</u> 1111 = <u>IRQ15</u>
19–16 ‡	MFUNC4	RW	Multifunction terminal 4 configuration. These bits control the internal signal mapped to the MFUNC4 terminal as follows: 0000 = <u>GPI3</u> 0100 = <u>IRQ4</u> 1000 = <u>CAUDPWM</u> 1100 = <u>RI_OUT</u> 0001 = <u>GPO3</u> 0101 = <u>SC_DBG_TX</u> 1001 = <u>IRQ9</u> 1101 = <u>LED_SKT</u> 0010 = <u>LOCK PCI</u> 0110 = <u>RSVD</u> 1010 = <u>INTD</u> 1110 = <u>GPE</u> 0011 = <u>IRQ3</u> 0111 = <u>RSVD</u> 1011 = <u>FM_LED</u> 1111 = <u>IRQ15</u>
15–12 ‡	MFUNC3	RW	Multifunction terminal 3 configuration. These bits control the internal signal mapped to the MFUNC3 terminal as follows: 0000 = <u>RSVD</u> 0100 = <u>IRQ4</u> 1000 = <u>IRQ8</u> 1100 = <u>IRQ12</u> 0001 = <u>IRQSER</u> 0101 = <u>IRQ5</u> 1001 = <u>IRQ9</u> 1101 = <u>IRQ13</u> 0010 = <u>IRQ2</u> 0110 = <u>IRQ6</u> 1010 = <u>IRQ10</u> 1110 = <u>IRQ14</u> 0011 = <u>IRQ3</u> 0111 = <u>IRQ7</u> 1011 = <u>IRQ11</u> 1111 = <u>IRQ15</u>
11–8 ‡	MFUNC2	RW	Multifunction terminal 2 configuration. These bits control the internal signal mapped to the MFUNC2 terminal as follows: 0000 = <u>GPI2</u> 0100 = <u>IRQ4</u> 1000 = <u>CAUDPWM</u> 1100 = <u>RI_OUT</u> 0001 = <u>GPO2</u> 0101 = <u>IRQ5</u> 1001 = <u>FM_LED</u> 1101 = <u>TEST_MUX</u> 0010 = <u>PCREQ</u> 0110 = <u>RSVD</u> 1010 = <u>IRQ10</u> 1110 = <u>GPE</u> 0011 = <u>IRQ3</u> 0111 = <u>RSVD</u> 1011 = <u>INTC</u> 1111 = <u>IRQ7</u>

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

Table 4–14. Multifunction Routing Status Register Description (Continued)

BIT	SIGNAL	TYPE	FUNCTION
7–4 ‡	MFUNC1	RW	Multifunction terminal 1 configuration. These bits control the internal signal mapped to the MFUNC1 terminal as follows: 0000 = GPI1 0100 = OHCI_LED 1000 = CAUDPWM 1100 = LEDA1 0001 = GPO1 0101 = IRQ5 1001 = IRQ9 1101 = LEDA2 0010 = INTB 0110 = RSVD 1010 = IRQ10 1110 = GPE 0011 = IRQ3 0111 = RSVD 1011 = IRQ11 1111 = IRQ15
3–0 ‡	MFUNC0	RW	Multifunction terminal 0 configuration. These bits control the internal signal mapped to the MFUNC0 terminal as follows: 0000 = GPIO 0100 = IRQ4 1000 = CAUDPWM 1100 = LEDA1 0001 = GPO0 0101 = IRQ5 1001 = IRQ9 1101 = LEDA2 0010 = INTA 0110 = RSVD 1010 = IRQ10 1110 = GPE 0011 = IRQ3 0111 = RSVD 1011 = IRQ11 1111 = IRQ15

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

4.37 Retry Status Register

The contents of the retry status register enable the retry time-out counters and display the retry expiration status. The flags are set when the PCI6x21/PCI6x11 controller, as a master, receives a retry and does not retry the request within 2^{15} clock cycles. The flags are cleared by writing a 1 to the bit. Access this register only through function 0. See Table 4–15 for a complete description of the register contents.

Bit	7	6	5	4	3	2	1	0
Name	Retry status							
Type	RW	RW	RC	R	RC	R	RC	R
Default	1	1	0	0	0	0	0	0

Register: **Retry status**
 Offset: 90h (Functions 0, 1)
 Type: Read-only, Read/Write, Read/Clear
 Default: C0h

Table 4–15. Retry Status Register Description

BIT	SIGNAL	TYPE	FUNCTION
7 ‡	PCIRETRY	RW	PCI retry time-out counter enable. This bit is encoded as: 0 = PCI retry counter disabled 1 = PCI retry counter enabled (default)
6 ‡§	CBRETRY	RW	CardBus retry time-out counter enable. This bit is encoded as: 0 = CardBus retry counter disabled 1 = CardBus retry counter enabled (default)
5 ‡	TEXP_CBB	RC	CardBus target B retry expired. Write a 1 to clear this bit. 0 = Inactive (default) 1 = Retry has expired.
4	RSVD	R	Reserved. This bit returns 0 when read.
3 ‡§	TEXP_CBA	RC	CardBus target A retry expired. Write a 1 to clear this bit. 0 = Inactive (default) 1 = Retry has expired.
2	RSVD	R	Reserved. This bit returns 0 when read.
1 ‡	TEXP_PCI	RC	PCI target retry expired. Write a 1 to clear this bit. 0 = Inactive (default) 1 = Retry has expired.
0	RSVD	R	Reserved. This bit returns 0 when read.

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

§ These bits are global in nature and must be accessed only through function 0.

4.38 Card Control Register

The card control register is provided for PCI1130 compatibility. RI_OUT is enabled through this register, and the enable bit is shared between functions 0 and 1. See Table 4–16 for a complete description of the register contents.

The RI_OUT signal is enabled through this register, and the enable bit is shared between functions 0 and 1.

Bit	7	6	5	4	3	2	1	0
Name	Card control							
Type	RW	RW	RW	R	R	RW	RW	RW
Default	0	0	0	0	0	0	0	0

Register: **Card control**
 Offset: 91h
 Type: Read-only, Read/Write
 Default: 00h

Table 4–16. Card Control Register Description

BIT	SIGNAL	TYPE	FUNCTION
7 ‡§	RIENB	RW	Ring indicate enable. When this bit is 1, the RI_OUT output is enabled. This bit defaults to 0.
6–3	RSVD	RW	These bits are reserved. Do not change the value of these bits.
2 ‡	AUD2MUX	RW	CardBus audio-to-MFUNC. When this bit is set, the CAUDIO CardBus signal must be routed through an MFUNC terminal. If this bit is set for both functions, then function 0 is routed. 0 = CAUDIO set to CAUDPWM on MFUNC terminal (default) 1 = CAUDIO is not routed.
1 ‡	SPKROUTEN	RW	When bit 1 is set, the SPKR terminal from the PC Card is enabled and is routed to the SPKROUT terminal. The SPKR signal from socket 0 is XORed with the SPKR signal from socket 1 and sent to SPKROUT. The SPKROUT terminal drives data only when the SPKROUTEN bit of either function is set. This bit is encoded as: 0 = SPKR to SPKROUT not enabled (default) 1 = SPKR to SPKROUT enabled
0 ‡	IFG	RW	Interrupt flag. This bit is the interrupt flag for 16-bit I/O PC Cards and for CardBus cards. This bit is set when a functional interrupt is signaled from a PC Card interface, and is socket dependent (i.e., not global). Write back a 1 to clear this bit. 0 = No PC Card functional interrupt detected (default) 1 = PC Card functional interrupt detected

‡ One or more bits in this register are cleared only by the assertion of GRST.

§ This bit is global in nature and must be accessed only through function 0.

4.39 Device Control Register

The device control register is provided for PCI1130 compatibility. It contains bits that are shared between functions 0 and 1. The interrupt mode select is programmed through this register. The socket-capable force bits are also programmed through this register. See Table 4–17 for a complete description of the register contents.

Bit	7	6	5	4	3	2	1	0
Name	Device control							
Type	RW	RW	RW	R	RW	RW	RW	RW
Default	0	1	1	0	0	1	1	0

Register: **Device control**
 Offset: 92h (Functions 0, 1)
 Type: Read-only, Read/Write
 Default: 66h

Table 4–17. Device Control Register Description

BIT	SIGNAL	TYPE	FUNCTION
7 ‡	SKTPWR_LOCK	RW	Socket power lock bit. When this bit is set to 1, software cannot power down the PC Card socket while in D3. It may be necessary to lock socket power in order to support wake on LAN or RING if the operating system is programmed to power down a socket when the CardBus controller is placed in the D3 state.
6 ‡§	3VCAPABLE	RW	3-V socket capable force bit. 0 = Not 3-V capable 1 = 3-V capable (default)
5 ‡	IO16R2	RW	Diagnostic bit. This bit defaults to 1.
4	RSVD	R	Reserved. This bit returns 0 when read. A write has no effect.
3 ‡§	TEST	RW	TI test bit. Write only 0 to this bit.
2–1 ‡§	INTMODE	RW	Interrupt mode. These bits select the interrupt signaling mode. The interrupt mode bits are encoded: 00 = Parallel PCI interrupts only 01 = Reserved 10 = IRQ serialized interrupts and parallel PCI interrupts \overline{INTA} , \overline{INTB} , \overline{INTC} , and \overline{INTD} 11 = IRQ and PCI serialized interrupts (default)
0 ‡§	RSVD	RW	Reserved. Bit 0 is reserved for test purposes. Only a 0 must be written to this bit.

‡ One or more bits in this register are cleared only by the assertion of \overline{GRST} .

§ These bits are global in nature and must be accessed only through function 0.

4.40 Diagnostic Register

The diagnostic register is provided for internal TI test purposes. It is a read/write register, but only 0s must be written to it. See Table 4–18 for a complete description of the register contents.

Bit	7	6	5	4	3	2	1	0
Name	Diagnostic							
Type	RW	R	RW	RW	RW	RW	RW	RW
Default	0	1	1	0	0	0	0	0

Register: **Diagnostic**
 Offset: 93h (functions 0, 1)
 Type: Read/Write
 Default: 60h

Table 4–18. Diagnostic Register Description

BIT	SIGNAL	TYPE	FUNCTION
7 ‡§	TRUE_VAL	RW	This bit defaults to 0. This bit is encoded as: 0 = Reads true values in PCI vendor ID and PCI device ID registers (default) 1 = Returns all 1s to reads from the PCI vendor ID and PCI device ID registers
6 ‡	RSVD	R	Reserved. This bit is read-only and returns 1 when read.
5 ‡	CSC	RW	CSC interrupt routing control 0 = CSC interrupts routed to PCI if ExCA 803 bit 4 = 1 1 = CSC interrupts routed to PCI if ExCA 805 bits 7–4 = 0000b (default). In this case, the setting of ExCA 803 bit 4 is a don't care.
4 ‡§	DIAG4	RW	Diagnostic RETRY_DIS. Delayed transaction disable.
3 ‡§	DIAG3	RW	Diagnostic RETRY_EXT. Extends the latency from 16 to 64.
2 ‡§	DIAG2	RW	Diagnostic DISCARD_TIM_SEL_CB. Set = 2 ¹⁰ , reset = 2 ¹⁵ .
1 ‡§	DIAG1	RW	Diagnostic DISCARD_TIM_SEL_PCI. Set = 2 ¹⁰ , reset = 2 ¹⁵ .
0 ‡	RSVD	RW	These bits are reserved. Do not change the value of these bits.

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

§ This bit is global and is accessed only through function 0.

4.41 Capability ID Register

The capability ID register identifies the linked list item as the register for PCI power management. The register returns 01h when read, which is the unique ID assigned by the PCI SIG for the PCI location of the capabilities pointer and the value.

Bit	7	6	5	4	3	2	1	0
Name	Capability ID							
Type	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	1

Register: **Capability ID**
Offset: A0h
Type: Read-only
Default: 01h

4.42 Next Item Pointer Register

The contents of this register indicate the next item in the linked list of the PCI power management capabilities. Because the PCI6x21/PCI6x11 functions only include one capabilities item, this register returns 0s when read.

Bit	7	6	5	4	3	2	1	0
Name	Next item pointer							
Type	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0

Register: **Next item pointer**
Offset: A1h
Type: Read-only
Default: 00h

4.43 Power Management Capabilities Register

The power management capabilities register contains information on the capabilities of the PC Card function related to power management. Both PCI6x21/PCI6x11 CardBus bridge functions support D0, D1, D2, and D3 power states. Default register value is FE12h for operation in accordance with *PCI Bus Power Management Interface Specification* revision 1.1. See Table 4–19 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Power management capabilities															
Type	RW	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	1	1	1	1	1	1	1	0	0	0	0	1	0	0	1	0

Register: **Power management capabilities**
 Offset: A2h (Functions 0, 1)
 Type: Read-only, Read/Write
 Default: FE12h

Table 4–19. Power Management Capabilities Register Description

BIT	SIGNAL	TYPE	FUNCTION
15 ‡	PME support	RW	This 5-bit field indicates the power states from which the PCI6x21/PCI6x11 controller functions can assert $\overline{\text{PME}}$. A 0 for any bit indicates that the function cannot assert the $\overline{\text{PME}}$ signal while in that power state. These 5 bits return 11111b when read. Each of these bits is described below: Bit 15 – defaults to a 1 indicating the $\overline{\text{PME}}$ signal can be asserted from the D3 _{COLD} state. This bit is read/write because wake-up support from D3 _{COLD} is contingent on the system providing an auxiliary power source to the V _{CC} terminals. If the system designer chooses not to provide an auxiliary power source to the V _{CC} terminals for D3 _{COLD} wake-up support, then BIOS must write a 0 to this bit.
14–11		R	Bit 14 – contains the value 1 to indicate that the $\overline{\text{PME}}$ signal can be asserted from the D3 _{HOT} state. Bit 13 – contains the value 1 to indicate that the $\overline{\text{PME}}$ signal can be asserted from the D2 state. Bit 12 – contains the value 1 to indicate that the $\overline{\text{PME}}$ signal can be asserted from the D1 state. Bit 11 – contains the value 1 to indicate that the $\overline{\text{PME}}$ signal can be asserted from the D0 state.
10		R	This bit returns a 1 when read, indicating that the function supports the D2 device power state.
9		R	This bit returns a 1 when read, indicating that the function supports the D1 device power state.
8–6		R	Reserved. These bits return 000b when read.
5	DSI	R	Device-specific initialization. This bit returns 0 when read.
4	AUX_PWR	R	Auxiliary power source. This bit is meaningful only if bit 15 (D3 _{COLD} supporting $\overline{\text{PME}}$) is set. When this bit is set, it indicates that support for $\overline{\text{PME}}$ in D3 _{COLD} requires auxiliary power supplied by the system by way of a proprietary delivery vehicle. A 0 (zero) in this bit field indicates that the function supplies its own auxiliary power source. If the function does not support PME while in the D3 _{COLD} state (bit 15=0), then this field must always return 0.
3	PMECLK	R	When this bit is 1, it indicates that the function relies on the presence of the PCI clock for $\overline{\text{PME}}$ operation. When this bit is 0, it indicates that no PCI clock is required for the function to generate $\overline{\text{PME}}$. Functions that do not support PME generation in any state must return 0 for this field.
2–0	Version	R	These 3 bits return 010b when read, indicating that there are 4 bytes of general-purpose power management (PM) registers as described in draft revision 1.1 of the <i>PCI Bus Power Management Interface Specification</i> .

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

4.44 Power Management Control/Status Register

The power management control/status register determines and changes the current power state of the PCI6x21/PCI6x11 CardBus function. The contents of this register are not affected by the internally generated reset caused by the transition from the D3_{hot} to D0 state. See Table 4–20 for a complete description of the register contents.

All PCI registers, ExCA registers, and CardBus registers are reset as a result of a D3_{hot}-to-D0 state transition, with the exception of the $\overline{\text{PME}}$ context bits (if $\overline{\text{PME}}$ is enabled) and the $\overline{\text{GRST}}$ only bits.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Power management control/status															
Type	RWC	R	R	R	R	R	R	RW	R	R	R	R	R	R	RW	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Power management control/status**
 Offset: A4h (Functions 0, 1)
 Type: Read-only, Read/Write, Read/Write/Clear
 Default: 0000h

Table 4–20. Power Management Control/Status Register Description

BIT	SIGNAL	TYPE	FUNCTION
15 †	PMESTAT	RC	PME status. This bit is set when the CardBus function would normally assert the $\overline{\text{PME}}$ signal, independent of the state of the $\overline{\text{PME_EN}}$ bit. This bit is cleared by a writeback of 1, and this also clears the $\overline{\text{PME}}$ signal if $\overline{\text{PME}}$ was asserted by this function. Writing a 0 to this bit has no effect.
14–13	DATASCALE	R	This 2-bit field returns 0s when read. The CardBus function does not return any dynamic data.
12–9	DATASEL	R	Data select. This 4-bit field returns 0s when read. The CardBus function does not return any dynamic data.
8 ‡	PME_ENABLE	RW	This bit enables the function to assert $\overline{\text{PME}}$. If this bit is cleared, then assertion of $\overline{\text{PME}}$ is disabled. This bit is not cleared by the assertion of $\overline{\text{PRST}}$. It is only cleared by the assertion of $\overline{\text{GRST}}$.
7–2	RSVD	R	Reserved. These bits return 0s when read.
1–0	PWRSTATE	RW	Power state. This 2-bit field is used both to determine the current power state of a function and to set the function into a new power state. This field is encoded as: 00 = D0 01 = D1 10 = D2 11 = D3 _{hot}

† One or more bits in this register are PME context bits and can be cleared only by the assertion of $\overline{\text{GRST}}$ when $\overline{\text{PME}}$ is enabled. If $\overline{\text{PME}}$ is not enabled, then this bit is cleared by the assertion of $\overline{\text{PRST}}$ or $\overline{\text{GRST}}$.

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

4.45 Power Management Control/Status Bridge Support Extensions Register

This register supports PCI bridge-specific functionality. It is required for all PCI-to-PCI bridges. See Table 4–21 for a complete description of the register contents.

Bit	7	6	5	4	3	2	1	0
Name	Power management control/status bridge support extensions							
Type	R	R	R	R	R	R	R	R
Default	1	1	0	0	0	0	0	0

Register: **Power management control/status bridge support extensions**
 Offset: A6h (Functions 0, 1)
 Type: Read-only
 Default: C0h

Table 4–21. Power Management Control/Status Bridge Support Extensions Register Description

BIT	SIGNAL	TYPE	FUNCTION
7	BPCC_EN	R	Bus power/clock control enable. This bit returns 1 when read. This bit is encoded as: 0 = Bus power/clock control is disabled. 1 = Bus power/clock control is enabled (default). A 0 indicates that the bus power/clock control policies defined in the <i>PCI Bus Power Management Interface Specification</i> are disabled. When the bus power/clock control enable mechanism is disabled, the power state field (bits 1–0) of the power management control/status register (PCI offset A4h, see Section 4.44) cannot be used by the system software to control the power or the clock of the secondary bus. A 1 indicates that the bus power/clock control mechanism is enabled.
6	$\overline{B2_B3}$	R	B2/B3 support for D3 _{hot} . The state of this bit determines the action that is to occur as a direct result of programming the function to D3 _{hot} . This bit is only meaningful if bit 7 (BPCC_EN) is a 1. This bit is encoded as: 0 = When the bridge is programmed to D3 _{hot} , its secondary bus has its power removed (B3). 1 = When the bridge function is programmed to D3 _{hot} , its secondary bus PCI clock is stopped (B2) (default).
5–0	RSVD	R	Reserved. These bits return 0s when read.

4.46 Power-Management Data Register

The power-management data register returns 0s when read, because the CardBus functions do not report dynamic data.

Bit	7	6	5	4	3	2	1	0
Name	Power-management data							
Type	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0

Register: **Power-management data**
 Offset: A7h (functions 0, 1)
 Type: Read-only
 Default: 00h

4.47 Serial Bus Data Register

The serial bus data register is for programmable serial bus byte reads and writes. This register represents the data when generating cycles on the serial bus interface. To write a byte, this register must be programmed with the data, the serial bus index register must be programmed with the byte address, the serial bus slave address must be programmed with the 7-bit slave address, and the read/write indicator bit must be reset.

On byte reads, the byte address is programmed into the serial bus index register, the serial bus slave address register must be programmed with both the 7-bit slave address and the read/write indicator bit, and bit 5 (REQBUSY) in the serial bus control and status register (see Section 4.50) must be polled until clear. Then the contents of this register are valid read data from the serial bus interface. See Table 4–22 for a complete description of the register contents.

Bit	7	6	5	4	3	2	1	0
Name	Serial bus data							
Type	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0

Register: **Serial bus data**
 Offset: B0h (function 0)
 Type: Read/Write
 Default: 00h

Table 4–22. Serial Bus Data Register Description

BIT	SIGNAL	TYPE	FUNCTION
7–0 ‡	SBDATA	RW	Serial bus data. This bit field represents the data byte in a read or write transaction on the serial interface. On reads, the REQBUSY bit must be polled to verify that the contents of this register are valid.

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

4.48 Serial Bus Index Register

The serial bus index register is for programmable serial bus byte reads and writes. This register represents the byte address when generating cycles on the serial bus interface. To write a byte, the serial bus data register must be programmed with the data, this register must be programmed with the byte address, and the serial bus slave address must be programmed with both the 7-bit slave address and the read/write indicator.

On byte reads, the word address is programmed into this register, the serial bus slave address must be programmed with both the 7-bit slave address and the read/write indicator bit, and bit 5 (REQBUSY) in the serial bus control and status register (see Section 4.50) must be polled until clear. Then the contents of the serial bus data register are valid read data from the serial bus interface. See Table 4–23 for a complete description of the register contents.

Bit	7	6	5	4	3	2	1	0
Name	Serial bus index							
Type	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0

Register: **Serial bus index**
 Offset: B1h (function 0)
 Type: Read/Write
 Default: 00h

Table 4–23. Serial Bus Index Register Description

BIT	SIGNAL	TYPE	FUNCTION
7–0 ‡	SINDEX	RW	Serial bus index. This bit field represents the byte address in a read or write transaction on the serial interface.

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

4.49 Serial Bus Slave Address Register

The serial bus slave address register is for programmable serial bus byte read and write transactions. To write a byte, the serial bus data register must be programmed with the data, the serial bus index register must be programmed with the byte address, and this register must be programmed with both the 7-bit slave address and the read/write indicator bit.

On byte reads, the byte address is programmed into the serial bus index register, this register must be programmed with both the 7-bit slave address and the read/write indicator bit, and bit 5 (REQBUSY) in the serial bus control and status register (see Section 4.50) must be polled until clear. Then the contents of the serial bus data register are valid read data from the serial bus interface. See Table 4–24 for a complete description of the register contents.

Bit	7	6	5	4	3	2	1	0
Name	Serial bus slave address							
Type	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0

Register: **Serial bus slave address**
 Offset: B2h (function 0)
 Type: Read/Write
 Default: 00h

Table 4–24. Serial Bus Slave Address Register Description

BIT	SIGNAL	TYPE	FUNCTION
7–1 ‡	SLAVADDR	RW	Serial bus slave address. This bit field represents the slave address of a read or write transaction on the serial interface.
0 ‡	RWCMD	RW	Read/write command. Bit 0 indicates the read/write command bit presented to the serial bus on byte read and write accesses. 0 = A byte write access is requested to the serial bus interface. 1 = A byte read access is requested to the serial bus interface.

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

4.50 Serial Bus Control/Status Register

The serial bus control and status register communicates serial bus status information and selects the quick command protocol. Bit 5 (REQBUSY) in this register must be polled during serial bus byte reads to indicate when data is valid in the serial bus data register. See Table 4–25 for a complete description of the register contents.

Bit	7	6	5	4	3	2	1	0
Name	Serial bus control/status							
Type	RW	R	R	R	RW	RW	RC	RC
Default	0	0	0	0	0	0	0	0

Register: **Serial bus control/status**
 Offset: B3h (function 0)
 Type: Read-only, Read/Write, Read/Clear
 Default: 00h

Table 4–25. Serial Bus Control/Status Register Description

BIT	SIGNAL	TYPE	FUNCTION
7 ‡	PROT_SEL	RW	Protocol select. When bit 7 is set, the send-byte protocol is used on write requests and the receive-byte protocol is used on read commands. The word address byte in the serial bus index register (see Section 4.48) is not output by the PCI6x21/PCI6x11 controller when bit 7 is set.
6	RSVD	R	Reserved. Bit 6 returns 0 when read.
5	REQBUSY	R	Requested serial bus access busy. Bit 5 indicates that a requested serial bus access (byte read or write) is in progress. A request is made, and bit 5 is set, by writing to the serial bus slave address register (see Section 4.49). Bit 5 must be polled on reads from the serial interface. After the byte read access has been completed, this bit is cleared and the read data is valid in the serial bus data register.
4	ROMBUSY	R	Serial EEPROM busy status. Bit 4 indicates the status of the PCI6x21/PCI6x11 serial EEPROM circuitry. Bit 4 is set during the loading of the subsystem ID and other default values from the serial bus EEPROM. 0 = Serial EEPROM circuitry is not busy 1 = Serial EEPROM circuitry is busy
3 ‡	SBDETECT	RW	Serial bus detect. When the serial bus interface is detected through a pullup resistor on the SCL terminal after reset, this bit is set to 1. 0 = Serial bus interface not detected 1 = Serial bus interface detected
2 ‡	SBTEST	RW	Serial bus test. When bit 2 is set, the serial bus clock frequency is increased for test purposes. 0 = Serial bus clock at normal operating frequency, ≈ 100 kHz (default) 1 = Serial bus clock frequency increased for test purposes
1 ‡	REQ_ERR	RC	Requested serial bus access error. Bit 1 indicates when a data error occurs on the serial interface during a requested cycle and may be set due to a missing acknowledge. Bit 1 is cleared by a writeback of 1. 0 = No error detected during user-requested byte read or write cycle 1 = Data error detected during user-requested byte read or write cycle
0 ‡	ROM_ERR	RC	EEPROM data error status. Bit 0 indicates when a data error occurs on the serial interface during the auto-load from the serial bus EEPROM and may be set due to a missing acknowledge. Bit 0 is also set on invalid EEPROM data formats. See Section 3.6.4, <i>Serial Bus EEPROM Application</i> , for details on EEPROM data format. Bit 0 is cleared by a writeback of 1. 0 = No error detected during autoloading from serial bus EEPROM 1 = Data error detected during autoloading from serial bus EEPROM

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

5 ExCA Compatibility Registers (Functions 0 and 1)

The ExCA (exchangeable card architecture) registers implemented in the PCI6x21/PCI6x11 controller are register-compatible with the Intel 82365SL-DF PCMCIA controller. ExCA registers are identified by an offset value, which is compatible with the legacy I/O index/data scheme used on the Intel™ 82365 ISA controller. The ExCA registers are accessed through this scheme by writing the register offset value into the index register (I/O base), and reading or writing the data register (I/O base + 1). The I/O base address used in the index/data scheme is programmed in the PC Card 16-bit I/F legacy mode base address register, which is shared by both card sockets. The offsets from this base address run contiguously from 00h to 3Fh for socket A, and from 40h to 7Fh for socket B. See Figure 5–1 for an ExCA I/O mapping illustration. Table 5–1 identifies each ExCA register and its respective ExCA offset.

The PCI6x21/PCI6x11 controller also provides a memory-mapped alias of the ExCA registers by directly mapping them into PCI memory space. They are located through the CardBus socket registers/ExCA registers base address register (PCI register 10h) at memory offset 800h. Each socket has a separate base address programmable by function. See Figure 5–2 for an ExCA memory mapping illustration. Note that memory offsets are 800h–844h for both functions 0 and 1. This illustration also identifies the CardBus socket register mapping, which is mapped into the same 4K window at memory offset 0h.

The interrupt registers in the ExCA register set, as defined by the 82365SL specification, control such card functions as reset, type, interrupt routing, and interrupt enables. Special attention must be paid to the interrupt routing registers and the host interrupt signaling method selected for the PCI6x21/PCI6x11 controller to ensure that all possible PCI6x21/PCI6x11 interrupts can potentially be routed to the programmable interrupt controller. The ExCA registers that are critical to the interrupt signaling are at memory address ExCA offsets 803h and 805h.

Access to I/O mapped 16-bit PC Cards is available to the host system via two ExCA I/O windows. These are regions of host I/O address space into which the card I/O space is mapped. These windows are defined by start, end, and offset addresses programmed in the ExCA registers described in this chapter. I/O windows have byte granularity.

Access to memory-mapped 16-bit PC Cards is available to the host system via five ExCA memory windows. These are regions of host memory space into which the card memory space is mapped. These windows are defined by start, end, and offset addresses programmed in the ExCA registers described in this chapter. Memory windows have 4-Kbyte granularity.

A bit location followed by a ‡ means that this bit is not cleared by the assertion of $\overline{\text{PRST}}$. This bit is only cleared by the assertion of $\overline{\text{GRST}}$. This is necessary to retain device context during the transition from D3 to D0.

5.1 ExCA Identification and Revision Register

This register provides host software with information on 16-bit PC Card support and 82365SL-DF compatibility. See Table 5–2 for a complete description of the register contents.

NOTE: If bit 5 (SUBSYRW) in the system control register is 1, then this register is read-only.

Bit	7	6	5	4	3	2	1	0
Name	ExCA identification and revision							
Type	R	R	RW	RW	RW	RW	RW	RW
Default	1	0	0	0	0	1	0	0

Register: **ExCA identification and revision**

Offset: CardBus Socket Address + 800h: Card A ExCA Offset 00h
Card B ExCA Offset 40h

Type: Read/Write, Read-only

Default: 84h

Table 5–2. ExCA Identification and Revision Register Description

BIT	SIGNAL	TYPE	FUNCTION
7–6 ‡	IFTYPE	R	Interface type. These bits, which are hardwired as 10b, identify the 16-bit PC Card support provided by the PCI6x21/PCI6x11 controller. The PCI6x21/PCI6x11 controller supports both I/O and memory 16-bit PC Cards.
5–4 ‡	RSVD	RW	These bits can be used for 82365SL emulation.
3–0 ‡	365REV	RW	82365SL-DF revision. This field stores the Intel 82365SL-DF revision supported by the PCI6x21/PCI6x11 controller. Host software can read this field to determine compatibility to the 82365SL-DF register set. This field defaults to 0100b upon reset. Writing 0010b to this field places the controller in the 82356SL mode.

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

5.2 ExCA Interface Status Register

This register provides information on current status of the PC Card interface. An X in the default bit values indicates that the value of the bit after reset depends on the state of the PC Card interface. See Table 5–3 for a complete description of the register contents.

Bit	7	6	5	4	3	2	1	0
Name	ExCA interface status							
Type	R	R	R	R	R	R	R	R
Default	0	0	X	X	X	X	X	X

Register: **ExCA interface status**
 Offset: CardBus Socket Address + 801h: Card A ExCA Offset 01h
 Card B ExCA Offset 41h
 Type: Read-only
 Default: 00XX XXXXb

Table 5–3. ExCA Interface Status Register Description

BIT	SIGNAL	TYPE	FUNCTION
7	RSVD	R	This bit returns 0 when read. A write has no effect.
6	CARDPWR	R	CARDPWR. Card power. This bit indicates the current power status of the PC Card socket. This bit reflects how the ExCA power control register has been programmed. The bit is encoded as: 0 = V_{CC} and V_{pp} to the socket are turned off (default). 1 = V_{CC} and V_{pp} to the socket are turned on.
5	READY	R	This bit indicates the current status of the READY signal at the PC Card interface. 0 = PC Card is not ready for a data transfer. 1 = PC Card is ready for a data transfer.
4	CARDWP	R	Card write protect. This bit indicates the current status of the WP signal at the PC Card interface. This signal reports to the PCI6x21/PCI6x11 controller whether or not the memory card is write protected. Further, write protection for an entire PCI6x21/PCI6x11 16-bit memory window is available by setting the appropriate bit in the ExCA memory window offset-address high-byte register. 0 = WP signal is 0. PC Card is R/W. 1 = WP signal is 1. PC Card is read-only.
3	CDETECT2	R	Card detect 2. This bit indicates the status of the CD2 signal at the PC Card interface. Software can use this and CDETECT1 to determine if a PC Card is fully seated in the socket. 0 = $\overline{CD2}$ signal is 1. No PC Card inserted. 1 = $\overline{CD2}$ signal is 0. PC Card at least partially inserted.
2	CDETECT1	R	Card detect 1. This bit indicates the status of the CD1 signal at the PC Card interface. Software can use this and CDETECT2 to determine if a PC Card is fully seated in the socket. 0 = $\overline{CD1}$ signal is 1. No PC Card inserted. 1 = $\overline{CD1}$ signal is 0. PC Card at least partially inserted.
1–0	BVDSTAT	R	Battery voltage detect. When a 16-bit memory card is inserted, the field indicates the status of the battery voltage detect signals (BVD1, BVD2) at the PC Card interface, where bit 0 reflects the BVD1 status, and bit 1 reflects BVD2. 00 = Battery is dead. 01 = Battery is dead. 10 = Battery is low; warning. 11 = Battery is good. When a 16-bit I/O card is inserted, this field indicates the status of the \overline{SPKR} (bit 1) signal and the \overline{STSCHG} (bit 0) at the PC Card interface. In this case, the two bits in this field directly reflect the current state of these card outputs.

5.4 ExCA Interrupt and General Control Register

This register controls interrupt routing for I/O interrupts as well as other critical 16-bit PC Card functions. See Table 5–6 for a complete description of the register contents.

Bit	7	6	5	4	3	2	1	0
Name	ExCA interrupt and general control							
Type	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0

Register: **ExCA interrupt and general control**
 Offset: CardBus Socket Address + 803h: Card A ExCA Offset 03h
 Card B ExCA Offset 43h
 Type: Read/Write
 Default: 00h

Table 5–6. ExCA Interrupt and General Control Register Description

BIT	SIGNAL	TYPE	FUNCTION
7	RINGEN	RW	Card ring indicate enable. Enables the ring indicate function of the BVD1/RI terminals. This bit is encoded as: 0 = Ring indicate disabled (default) 1 = Ring indicate enabled
6 †	RESET	RW	Card reset. This bit controls the 16-bit PC Card RESET signal, and allows host software to force a card reset. This bit affects 16-bit cards only. This bit is encoded as: 0 = RESET signal asserted (default) 1 = RESET signal deasserted.
5 †	CARDTYPE	RW	Card type. This bit indicates the PC Card type. This bit is encoded as: 0 = Memory PC Card is installed (default) 1 = I/O PC Card is installed
4	CSCROUTE	RW	PCI interrupt – CSC routing enable bit. This bit has meaning only if the CSC interrupt routing control bit (PCI offset 93h, bit 5) is 0. In this case, when this bit is set (high), the card status change interrupts are routed to PCI interrupts. When low, the card status change interrupts are routed using bits 7–4 in the ExCA card status-change interrupt configuration register (ExCA offset 805h, see Section 5.6). This bit is encoded as: 0 = CSC interrupts routed by ExCA registers (default) 1 = CSC interrupts routed to PCI interrupts If the CSC interrupt routing control bit (bit 5) of the diagnostic register (PCI offset 93h, see Section 4.40) is set to 1, this bit has no meaning, which is the default case.
3–0	INTSELECT	RW	Card interrupt select for I/O PC Card functional interrupts. These bits select the interrupt routing for I/O PC Card functional interrupts. This field is encoded as: 0000 = No IRQ selected (default). CSC interrupts are routed to PCI Interrupts. This bit setting is ORed with bit 4 (CSCROUTE) for backward compatibility. 0001 = IRQ1 enabled 0010 = SMI enabled 0011 = IRQ3 enabled 0100 = IRQ4 enabled 0101 = IRQ5 enabled 0110 = IRQ6 enabled 0111 = IRQ7 enabled 1000 = IRQ8 enabled 1001 = IRQ9 enabled 1010 = IRQ10 enabled 1011 = IRQ11 enabled 1100 = IRQ12 enabled 1101 = IRQ13 enabled 1110 = IRQ14 enabled 1111 = IRQ15 enabled

† This bit is cleared only by the assertion of GRST when PME is enabled. If PME is not enabled, then this bit is cleared by the assertion of PRST or GRST.

5.5 ExCA Card Status-Change Register

The ExCA card status-change register controls interrupt routing for I/O interrupts as well as other critical 16-bit PC Card functions. The register enables these interrupt sources to generate an interrupt to the host. When the interrupt source is disabled, the corresponding bit in this register always reads 0. When an interrupt source is enabled, the corresponding bit in this register is set to indicate that the interrupt source is active. After generating the interrupt to the host, the interrupt service routine must read this register to determine the source of the interrupt. The interrupt service routine is responsible for resetting the bits in this register as well. Resetting a bit is accomplished by one of two methods: a read of this register or an explicit writeback of 1 to the status bit. The choice of these two methods is based on bit 2 (interrupt flag clear mode select) in the ExCA global control register (CB offset 81Eh, see Section 5.20). See Table 5–7 for a complete description of the register contents.

Bit	7	6	5	4	3	2	1	0
Name	ExCA card status-change							
Type	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0

Register: **ExCA card status-change**
 Type: Read-only
 Offset: CardBus socket address + 804h; Card A ExCA offset 04h
 Card B ExCA offset 44h
 Default: 00h

Table 5–7. ExCA Card Status-Change Register Description

BIT	SIGNAL	TYPE	FUNCTION
7–4	RSVD	R	Reserved. Bits 7–4 return 0s when read.
3 †	CDCHANGE	R	Card detect change. Bit 3 indicates whether a change on $\overline{CD1}$ or $\overline{CD2}$ occurred at the PC Card interface. This bit is encoded as: 0 = No change detected on either $\overline{CD1}$ or $\overline{CD2}$ 1 = Change detected on either $\overline{CD1}$ or $\overline{CD2}$
2 †	READYCHANGE	R	Ready change. When a 16-bit memory is installed in the socket, bit 2 includes whether the source of a PCI6x21/PCI6x11 interrupt was due to a change on READY at the PC Card interface, indicating that the PC Card is now ready to accept new data. This bit is encoded as: 0 = No low-to-high transition detected on READY (default) 1 = Detected low-to-high transition on READY When a 16-bit I/O card is installed, bit 2 is always 0.
1 †	BATWARN	R	Battery warning change. When a 16-bit memory card is installed in the socket, bit 1 indicates whether the source of a PCI6x21/PCI6x11 interrupt was due to a battery-low warning condition. This bit is encoded as: 0 = No battery warning condition (default) 1 = Detected battery warning condition When a 16-bit I/O card is installed, bit 1 is always 0.
0 †	BATDEAD	R	Battery dead or status change. When a 16-bit memory card is installed in the socket, bit 0 indicates whether the source of a PCI6x21/PCI6x11 interrupt was due to a battery dead condition. This bit is encoded as: 0 = \overline{STSCHG} deasserted (default) 1 = \overline{STSCHG} asserted Ring indicate. When the PCI6x21/PCI6x11 is configured for ring indicate operation, bit 0 indicates the status of RI.

† These are PME context bits and can be cleared only by the assertion of \overline{GRST} when \overline{PME} is enabled. If \overline{PME} is not enabled, then these bits are cleared by the assertion of \overline{PRST} or \overline{GRST} .

5.7 ExCA Address Window Enable Register

The ExCA address window enable register enables/disables the memory and I/O windows to the 16-bit PC Card. By default, all windows to the card are disabled. The PCI16x21/PCI16x11 controller does not acknowledge PCI memory or I/O cycles to the card if the corresponding enable bit in this register is 0, regardless of the programming of the memory or I/O window start/end/offset address registers. See Table 5–9 for a complete description of the register contents.

Bit	7	6	5	4	3	2	1	0
Name	ExCA address window enable							
Type	RW	RW	R	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0

Register: **ExCA address window enable**
 Type: Read-only, Read/Write
 Offset: CardBus socket address + 806h; Card A ExCA offset 06h
 Card B ExCA offset 46h
 Default: 00h

Table 5–9. ExCA Address Window Enable Register Description

BIT	SIGNAL	TYPE	FUNCTION
7	IOWIN1EN	RW	I/O window 1 enable. Bit 7 enables/disables I/O window 1 for the PC Card. This bit is encoded as: 0 = I/O window 1 disabled (default) 1 = I/O window 1 enabled
6	IOWIN0EN	RW	I/O window 0 enable. Bit 6 enables/disables I/O window 0 for the PC Card. This bit is encoded as: 0 = I/O window 0 disabled (default) 1 = I/O window 0 enabled
5	RSVD	R	Reserved. Bit 5 returns 0 when read.
4	MEMWIN4EN	RW	Memory window 4 enable. Bit 4 enables/disables memory window 4 for the PC Card. This bit is encoded as: 0 = Memory window 4 disabled (default) 1 = Memory window 4 enabled
3	MEMWIN3EN	RW	Memory window 3 enable. Bit 3 enables/disables memory window 3 for the PC Card. This bit is encoded as: 0 = Memory window 3 disabled (default) 1 = Memory window 3 enabled
2	MEMWIN2EN	RW	Memory window 2 enable. Bit 2 enables/disables memory window 2 for the PC Card. This bit is encoded as: 0 = Memory window 2 disabled (default) 1 = Memory window 2 enabled
1	MEMWIN1EN	RW	Memory window 1 enable. Bit 1 enables/disables memory window 1 for the PC Card. This bit is encoded as: 0 = Memory window 1 disabled (default) 1 = Memory window 1 enabled
0	MEMWIN0EN	RW	Memory window 0 enable. Bit 0 enables/disables memory window 0 for the PC Card. This bit is encoded as: 0 = Memory window 0 disabled (default) 1 = Memory window 0 enabled

5.8 ExCA I/O Window Control Register

The ExCA I/O window control register contains parameters related to I/O window sizing and cycle timing. See Table 5–10 for a complete description of the register contents.

Bit	7	6	5	4	3	2	1	0
Name	ExCA I/O window control							
Type	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0

Register: **ExCA I/O window control**
 Type: Read/Write
 Offset: CardBus socket address + 807h: Card A ExCA offset 07h
 Card B ExCA offset 47h
 Default: 00h

Table 5–10. ExCA I/O Window Control Register Description

BIT	SIGNAL	TYPE	FUNCTION
7	WAITSTATE1	RW	I/O window 1 wait state. Bit 7 controls the I/O window 1 wait state for 16-bit I/O accesses. Bit 7 has no effect on 8-bit accesses. This wait-state timing emulates the ISA wait state used by the Intel 82365SL-DF. This bit is encoded as: 0 = 16-bit cycles have standard length (default). 1 = 16-bit cycles are extended by one equivalent ISA wait state.
6	ZEROWS1	RW	I/O window 1 zero wait state. Bit 6 controls the I/O window 1 wait state for 8-bit I/O accesses. Bit 6 has no effect on 16-bit accesses. This wait-state timing emulates the ISA wait state used by the Intel 82365SL-DF. This bit is encoded as: 0 = 8-bit cycles have standard length (default). 1 = 8-bit cycles are reduced to equivalent of three ISA cycles.
5	IOSIS16W1	RW	I/O window 1 $\overline{\text{IOSIS16}}$ source. Bit 5 controls the I/O window 1 automatic data-sizing feature that uses $\overline{\text{IOSIS16}}$ from the PC Card to determine the data width of the I/O data transfer. This bit is encoded as: 0 = Window data width determined by DATASIZE1, bit 4 (default). 1 = Window data width determined by $\overline{\text{IOSIS16}}$.
4	DATASIZE1	RW	I/O window 1 data size. Bit 4 controls the I/O window 1 data size. Bit 4 is ignored if bit 5 (IOSIS16W1) is set. This bit is encoded as: 0 = Window data width is 8 bits (default). 1 = Window data width is 16 bits.
3	WAITSTATE0	RW	I/O window 0 wait state. Bit 3 controls the I/O window 0 wait state for 16-bit I/O accesses. Bit 3 has no effect on 8-bit accesses. This wait-state timing emulates the ISA wait state used by the Intel 82365SL-DF. This bit is encoded as: 0 = 16-bit cycles have standard length (default). 1 = 16-bit cycles are extended by one equivalent ISA wait state.
2	ZEROWS0	RW	I/O window 0 zero wait state. Bit 2 controls the I/O window 0 wait state for 8-bit I/O accesses. Bit 2 has no effect on 16-bit accesses. This wait-state timing emulates the ISA wait state used by the Intel 82365SL-DF. This bit is encoded as: 0 = 8-bit cycles have standard length (default). 1 = 8-bit cycles are reduced to equivalent of three ISA cycles.
1	IOSIS16W0	RW	I/O window 0 $\overline{\text{IOSIS16}}$ source. Bit 1 controls the I/O window 0 automatic data sizing feature that uses $\overline{\text{IOSIS16}}$ from the PC Card to determine the data width of the I/O data transfer. This bit is encoded as: 0 = Window data width is determined by DATASIZE0, bit 0 (default). 1 = Window data width is determined by $\overline{\text{IOSIS16}}$.
0	DATASIZE0	RW	I/O window 0 data size. Bit 0 controls the I/O window 0 data size. Bit 0 is ignored if bit 1 (IOSIS16W0) is set. This bit is encoded as: 0 = Window data width is 8 bits (default). 1 = Window data width is 16 bits.

5.19 ExCA Card Detect and General Control Register

This register controls how the ExCA registers for the socket respond to card removal. It also reports the status of the $\overline{VS1}$ and $\overline{VS2}$ signals at the PC Card interface. Table 5–14 describes each bit in the ExCA card detect and general control register.

Bit	7	6	5	4	3	2	1	0
Name	ExCA card detect and general control							
Type	R	R	W	RW	R	R	RW	R
Default	X	X	0	0	0	0	0	0

Register: **ExCA card detect and general control**
 Offset: CardBus Socket Address + 816h: Card A ExCA Offset 16h
 Card B ExCA Offset 56h
 Type: Read-only, Write-only, Read/Write
 Default: XX00 0000b

Table 5–14. ExCA Card Detect and General Control Register Description

BIT	SIGNAL	TYPE	FUNCTION
7 †	VS2STAT	R	VS2. This bit reports the current state of the $\overline{VS2}$ signal at the PC Card interface, and, therefore, does not have a default value. 0 = $\overline{VS2}$ is low. 1 = $\overline{VS2}$ is high.
6 †	VS1STAT	R	VS1. This bit reports the current state of the $\overline{VS1}$ signal at the PC Card interface, and, therefore, does not have a default value. 0 = $\overline{VS1}$ is low. 1 = $\overline{VS1}$ is high.
5	SWCSC	W	Software card detect interrupt. If card detect enable, bit 3 in the ExCA card status change interrupt configuration register (ExCA offset 805h, see Section 5.6) is set, then writing a 1 to this bit causes a card-detect card-status-change interrupt for the associated card socket. If the card-detect enable bit is cleared to 0 in the ExCA card status-change interrupt configuration register (ExCA offset 805h, see Section 5.6), then writing a 1 to the software card-detect interrupt bit has no effect. This bit is write-only. A read operation of this bit always returns 0. Writing a 1 to this bit also clears it. If bit 2 of the ExCA global control register (ExCA offset 81Eh, see Section 5.20) is set and a 1 is written to clear bit 3 of the ExCA card status change interrupt register, then this bit also is cleared.
4	CDRESUME	RW	Card detect resume enable. If this bit is set to 1 and a card detect change has been detected on the $\overline{CD1}$ and $\overline{CD2}$ inputs, then the $\overline{RI_OUT}$ output goes from high to low. The $\overline{RI_OUT}$ remains low until the card status change bit in the ExCA card status-change register (ExCA offset 804h, see Section 5.5) is cleared. If this bit is a 0, then the card detect resume functionality is disabled. 0 = Card detect resume disabled (default) 1 = Card detect resume enabled
3–2	RSVD	R	These bits return 0s when read. Writes have no effect.
1	REGCONFIG	RW	Register configuration upon card removal. This bit controls how the ExCA registers for the socket react to a card removal event. This bit is encoded as: 0 = No change to ExCA registers upon card removal (default) 1 = Reset ExCA registers upon card removal
0	RSVD	R	This bit returns 0 when read. A write has no effect.

† One or more bits in this register are cleared only by the assertion of \overline{GRST} when \overline{PME} is enabled. If \overline{PME} is not enabled, then this bit is cleared by the assertion of \overline{PRST} or \overline{GRST} .

5.20 ExCA Global Control Register

This register controls both PC Card sockets, and is not duplicated for each socket. The host interrupt mode bits in this register are retained for 82365SL-DF compatibility. See Table 5–15 for a complete description of the register contents.

Bit	7	6	5	4	3	2	1	0
Name	ExCA global control							
Type	R	R	R	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0

Register: **ExCA global control**
 Offset: CardBus Socket Address + 81Eh: Card A ExCA Offset 1Eh
 Card B ExCA Offset 5Eh
 Type: Read-only, Read/Write
 Default: 00h

Table 5–15. ExCA Global Control Register Description

BIT	SIGNAL	TYPE	FUNCTION
7–5	RSVD	R	These bits return 0s when read. Writes have no effect.
4	INTMODEB	RW	Level/edge interrupt mode select, card B. This bit selects the signaling mode for the PCI6x21/PCI6x11 host interrupt for card B interrupts. This bit is encoded as: 0 = Host interrupt is edge mode (default). 1 = Host interrupt is level mode.
3	INTMODEA	RW	Level/edge interrupt mode select, card A. This bit selects the signaling mode for the PCI6x21/PCI6x11 host interrupt for card A interrupts. This bit is encoded as: 0 = Host interrupt is edge-mode (default). 1 = Host interrupt is level-mode.
2 ‡	IFCMODE	RW	Interrupt flag clear mode select. This bit selects the interrupt flag clear mechanism for the flags in the ExCA card status change register. This bit is encoded as: 0 = Interrupt flags cleared by read of CSC register (default) 1 = Interrupt flags cleared by explicit writeback of 1
1 ‡	CSCMODE	RW	Card status change level/edge mode select. This bit selects the signaling mode for the PCI6x21/PCI6x11 host interrupt for card status changes. This bit is encoded as: 0 = Host interrupt is edge-mode (default). 1 = Host interrupt is level-mode.
0 ‡	PWRDWN	RW	Power-down mode select. When this bit is set to 1, the PCI6x21/PCI6x11 controller is in power-down mode. In power-down mode the PCI6x21/PCI6x11 card outputs are placed in a high-impedance state until an active cycle is executed on the card interface. Following an active cycle the outputs are again placed in a high-impedance state. The PCI6x21/PCI6x11 controller still receives functional interrupts and/or card status change interrupts; however, an actual card access is required to wake up the interface. This bit is encoded as: 0 = Power-down mode disabled (default) 1 = Power-down mode enabled

‡ One or more bits in this register are cleared only by the assertion of GRST.

5.23 ExCA Memory Windows 0–4 Page Registers

The upper 8 bits of a 4-byte PCI memory address are compared to the contents of this register when decoding addresses for 16-bit memory windows. Each window has its own page register, all of which default to 00h. By programming this register to a nonzero value, host software can locate 16-bit memory windows in any one of 256 16-Mbyte regions in the 4-gigabyte PCI address space. These registers are only accessible when the ExCA registers are memory-mapped, that is, these registers may not be accessed using the index/data I/O scheme.

Bit	7	6	5	4	3	2	1	0
Name	ExCA memory windows 0–4 page							
Type	RW	RW	RW	RW	RW	RW	RW	R
Default	0	0	0	0	0	0	0	0

Register: **ExCA memory windows 0–4 page**
 Offset: CardBus Socket Address + 840h, 841h, 842h, 843h, 844h
 Type: Read/Write
 Default: 00h

6 CardBus Socket Registers (Functions 0 and 1)

The 1997 PC Card Standard requires a CardBus socket controller to provide five 32-bit registers that report and control socket-specific functions. The PCI6x21/PCI6x11 controller provides the CardBus socket/ExCA base address register (PCI offset 10h, see Section 4.12) to locate these CardBus socket registers in PCI memory address space. Each function has a separate base address register for accessing the CardBus socket registers (see Figure 6–1). Table 6–1 gives the location of the socket registers in relation to the CardBus socket/ExCA base address.

In addition to the five required registers, the PCI6x21/PCI6x11 controller implements a register at offset 20h that provides power management control for the socket.

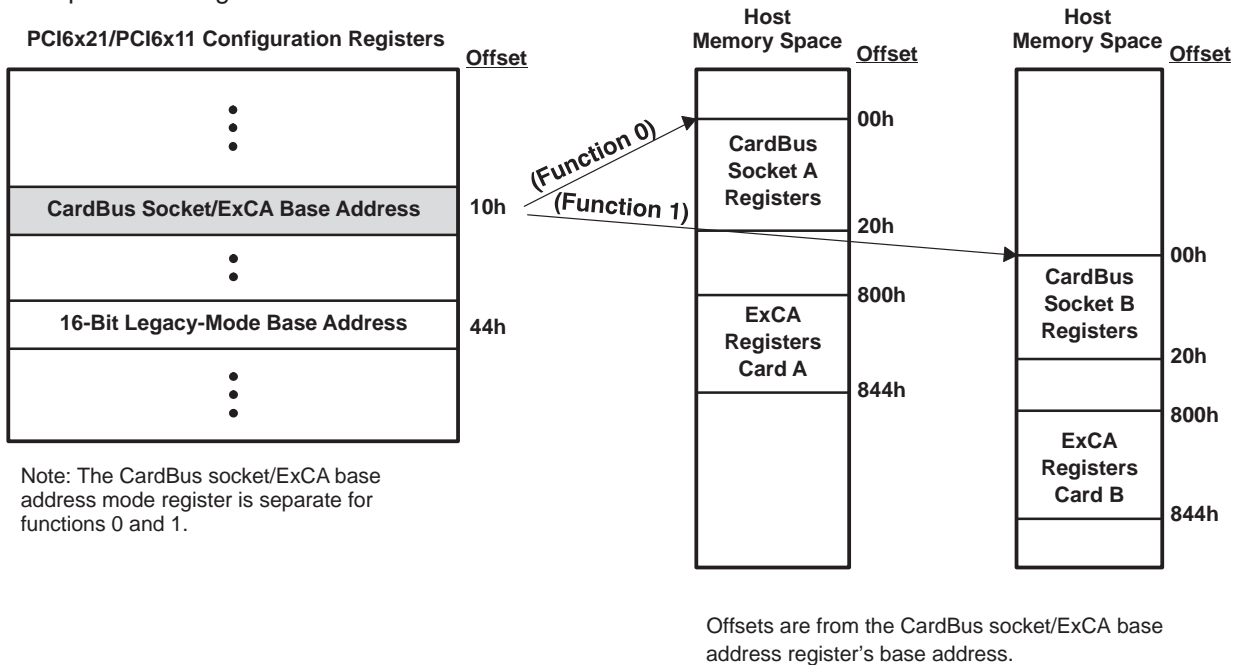

Figure 6–1. Accessing CardBus Socket Registers Through PCI Memory

Table 6–1. CardBus Socket Registers

REGISTER NAME	OFFSET
Socket event †	00h
Socket mask †	04h
Socket present state †	08h
Socket force event	0Ch
Socket control †	10h
Reserved	14h–1Ch
Socket power management ‡	20h

† One or more bits in the register are PME context bits and can be cleared only by the assertion of $\overline{\text{GRST}}$ when $\overline{\text{PME}}$ is enabled. If $\overline{\text{PME}}$ is not enabled, then these bits are cleared by the assertion of $\overline{\text{PRST}}$ or $\overline{\text{GRST}}$.

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

6.1 Socket Event Register

This register indicates a change in socket status has occurred. These bits do not indicate what the change is, only that one has occurred. Software must read the socket present state register for current status. Each bit in this register can be cleared by writing a 1 to that bit. The bits in this register can be set to a 1 by software through writing a 1 to the corresponding bit in the socket force event register. All bits in this register are cleared by PCI reset. They can be immediately set again, if, when coming out of PC Card reset, the bridge finds the status unchanged (i.e., CSTSCHG reasserted or card detect is still true). Software needs to clear this register before enabling interrupts. If it is not cleared and interrupts are enabled, then an unmasked interrupt is generated based on any bit that is set. See Table 6–2 for a complete description of the register contents.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	Socket event															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Socket event															
Type	R	R	R	R	R	R	R	R	R	R	R	R	RWC	RWC	RWC	RWC
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Socket event**
 Offset: CardBus Socket Address + 00h
 Type: Read-only, Read/Write to Clear
 Default: 0000 0000h

Table 6–2. Socket Event Register Description

BIT	SIGNAL	TYPE	FUNCTION
31–4	RSVD	R	These bits return 0s when read.
3†	PWREVENT	RWC	Power cycle. This bit is set when the PCI6x21/PCI6x11 controller detects that the PWRCYCLE bit in the socket present state register (offset 08h, see Section 6.3) has changed. This bit is cleared by writing a 1.
2†	CD2EVENT	RWC	$\overline{CCD2}$. This bit is set when the PCI6x21/PCI6x11 controller detects that the CDETECT2 field in the socket present state register (offset 08h, see Section 6.3) has changed. This bit is cleared by writing a 1.
1†	CD1EVENT	RWC	$\overline{CCD1}$. This bit is set when the PCI6x21/PCI6x11 controller detects that the CDETECT1 field in the socket present state register (offset 08h, see Section 6.3) has changed. This bit is cleared by writing a 1.
0†	CSTSEVENT	RWC	CSTSCHG. This bit is set when the CARDSTS field in the socket present state register (offset 08h, see Section 6.3) has changed state. For CardBus cards, this bit is set on the rising edge of the CSTSCHG signal. For 16-bit PC Cards, this bit is set on both transitions of the CSTSCHG signal. This bit is reset by writing a 1.

† This bit is cleared only by the assertion of \overline{GRST} when \overline{PME} is enabled. If \overline{PME} is not enabled, then this bit is cleared by the assertion of \overline{PRST} or \overline{GRST} .

6.2 Socket Mask Register

This register allows software to control the CardBus card events which generate a status change interrupt. The state of these mask bits does not prevent the corresponding bits from reacting in the socket event register (offset 00h, see Section 6.1). See Table 6–3 for a complete description of the register contents.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	Socket mask															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Socket mask															
Type	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Socket mask**
 Offset: CardBus Socket Address + 04h
 Type: Read-only, Read/Write
 Default: 0000 0000h

Table 6–3. Socket Mask Register Description

BIT	SIGNAL	TYPE	FUNCTION
31–4	RSVD	R	These bits return 0s when read.
3†	PWRMASK	RW	Power cycle. This bit masks the PWRCYCLE bit in the socket present state register (offset 08h, see Section 6.3) from causing a status change interrupt. 0 = PWRCYCLE event does not cause a CSC interrupt (default). 1 = PWRCYCLE event causes a CSC interrupt.
2–1†	CDMASK	RW	Card detect mask. These bits mask the CDETECT1 and CDETECT2 bits in the socket present state register (offset 08h, see Section 6.3) from causing a CSC interrupt. 00 = Insertion/removal does not cause a CSC interrupt (default). 01 = Reserved (undefined) 10 = Reserved (undefined) 11 = Insertion/removal causes a CSC interrupt.
0†	CSTSMASK	RW	CSTSCHG mask. This bit masks the CARDSTS field in the socket present state register (offset 08h, see Section 6.3) from causing a CSC interrupt. 0 = CARDSTS event does not cause a CSC interrupt (default). 1 = CARDSTS event causes a CSC interrupt.

† This bit is cleared only by the assertion of $\overline{\text{GRST}}$ when $\overline{\text{PME}}$ is enabled. If $\overline{\text{PME}}$ is not enabled, then this bit is cleared by the assertion of PRST or GRST.

6.3 Socket Present State Register

This register reports information about the socket interface. Writes to the socket force event register (offset 0Ch, see Section 6.4), as well as general socket interface status, are reflected here. Information about PC Card V_{CC} support and card type is only updated at each insertion. Also note that the PCI6x21/PCI6x11 controller uses the CCD1 and CCD2 signals during card identification, and changes on these signals during this operation are not reflected in this register.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	Socket present state															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Socket present state															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0	0	X	0	0	0	X	X	X

Register: **Socket present state**
 Offset: CardBus Socket Address + 08h
 Type: Read-only
 Default: 3000 00XXh

Table 6–4. Socket Present State Register Description

BIT	SIGNAL	TYPE	FUNCTION
31	YVSOCKET	R	YV socket. This bit indicates whether or not the socket can supply $V_{CC} = Y.Y$ V to PC Cards. The PCI6x21/PCI6x11 controller does not support Y.Y-V V_{CC} ; therefore, this bit is always reset unless overridden by the socket force event register (offset 0Ch, see Section 6.4). This bit defaults to 0.
30	XVSOCKET	R	XV socket. This bit indicates whether or not the socket can supply $V_{CC} = X.X$ V to PC Cards. The PCI6x21/PCI6x11 controller does not support X.X-V V_{CC} ; therefore, this bit is always reset unless overridden by the socket force event register (offset 0Ch, see Section 6.4). This bit defaults to 0.
29	3VSOCKET	R	3-V socket. This bit indicates whether or not the socket can supply $V_{CC} = 3.3$ Vdc to PC Cards. The PCI6x21/PCI6x11 controller does support 3.3-V V_{CC} ; therefore, this bit is always set unless overridden by the socket force event register (offset 0Ch, see Section 6.4).
28	5VSOCKET	R	5-V socket. This bit indicates whether or not the socket can supply $V_{CC} = 5$ Vdc to PC Cards. The PCI6x21/PCI6x11 controller does support 5-V V_{CC} ; therefore, this bit is always set unless overridden by bit 6 of the device control register (PCI offset 92h, see Section 4.39).
27–14	RSVD	R	These bits return 0s when read.
13 †	YVCARD	R	YV card. This bit indicates whether or not the PC Card inserted in the socket supports $V_{CC} = Y.Y$ Vdc. This bit can be set by writing a 1 to the corresponding bit in the socket force event register (offset 0Ch, see Section 6.4).
12 †	XVCARD	R	XV card. This bit indicates whether or not the PC Card inserted in the socket supports $V_{CC} = X.X$ Vdc. This bit can be set by writing a 1 to the corresponding bit in the socket force event register (offset 0Ch, see Section 6.4).
11 †	3VCARD	R	3-V card. This bit indicates whether or not the PC Card inserted in the socket supports $V_{CC} = 3.3$ Vdc. This bit can be set by writing a 1 to the corresponding bit in the socket force event register (offset 0Ch, see Section 6.4).
10 †	5VCARD	R	5-V card. This bit indicates whether or not the PC Card inserted in the socket supports $V_{CC} = 5$ Vdc. This bit can be set by writing a 1 to the corresponding bit in the socket force event register (offset 0Ch, see Section 6.4).

† One or more bits in the register are PME context bits and can be cleared only by the assertion of GRST when PME is enabled. If PME is not enabled, then these bits are cleared by the assertion of PRST or GRST.

Table 6–4. Socket Present State Register Description (Continued)

BIT	SIGNAL	TYPE	FUNCTION
9 †	BADVCCREQ	R	Bad V _{CC} request. This bit indicates that the host software has requested that the socket be powered at an invalid voltage. 0 = Normal operation (default) 1 = Invalid V _{CC} request by host software
8 †	DATALOST	R	Data lost. This bit indicates that a PC Card removal event may have caused lost data because the cycle did not terminate properly or because write data still resides in the PCI6x21/PCI6x11 controller. 0 = Normal operation (default) 1 = Potential data loss due to card removal
7 †	NOTACARD	R	Not a card. This bit indicates that an unrecognizable PC Card has been inserted in the socket. This bit is not updated until a valid PC Card is inserted into the socket. 0 = Normal operation (default) 1 = Unrecognizable PC Card detected
6	IREQCINT	R	READY(<u>IREQ</u>)/ <u>CINT</u> . This bit indicates the current status of the READY(<u>IREQ</u>)/ <u>CINT</u> signal at the PC Card interface. 0 = READY(<u>IREQ</u>)/ <u>CINT</u> is low. 1 = READY(<u>IREQ</u>)/ <u>CINT</u> is high.
5 †	CBCARD	R	CardBus card detected. This bit indicates that a CardBus PC Card is inserted in the socket. This bit is not updated until another card interrogation sequence occurs (card insertion).
4 †	16BITCARD	R	16-bit card detected. This bit indicates that a 16-bit PC Card is inserted in the socket. This bit is not updated until another card interrogation sequence occurs (card insertion).
3 †	PWRCYCLE	R	Power cycle. This bit indicates the status of each card powering request. This bit is encoded as: 0 = Socket is powered down (default). 1 = Socket is powered up.
2 †	CDETECT2	R	<u>CCD2</u> . This bit reflects the current status of the <u>CCD2</u> signal at the PC Card interface. Changes to this signal during card interrogation are not reflected here. 0 = <u>CCD2</u> is low (PC Card may be present) 1 = <u>CCD2</u> is high (PC Card not present)
1 †	CDETECT1	R	<u>CCD1</u> . This bit reflects the current status of the <u>CCD1</u> signal at the PC Card interface. Changes to this signal during card interrogation are not reflected here. 0 = <u>CCD1</u> is low (PC Card may be present). 1 = <u>CCD1</u> is high (PC Card not present).
0	CARDSTS	R	<u>CSTSCHG</u> . This bit reflects the current status of the <u>CSTSCHG</u> signal at the PC Card interface. 0 = <u>CSTSCHG</u> is low. 1 = <u>CSTSCHG</u> is high.

† One or more bits in the register are PME context bits and can be cleared only by the assertion of GRST when PME is enabled. If PME is not enabled, then these bits are cleared by the assertion of PRST or GRST.

6.4 Socket Force Event Register

This register is used to force changes to the socket event register (offset 00h, see Section 6.1) and the socket present state register (offset 08h, see Section 6.3). The CVSTEST bit (bit 14) in this register must be written when forcing changes that require card interrogation. See Table 6–5 for a complete description of the register contents.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	Socket force event															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Socket force event															
Type	R	W	W	W	W	W	W	W	W	R	W	W	W	W	W	W
Default	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X

Register: **Socket force event**
 Offset: CardBus Socket Address + 0Ch
 Type: Read-only, Write-only
 Default: 0000 XXXXh

Table 6–5. Socket Force Event Register Description

BIT	SIGNAL	TYPE	FUNCTION
31–15	RSVD	R	Reserved. These bits return 0s when read.
14	CVSTEST	W	Card VS test. When this bit is set, the PCI6x21/PCI6x11 controller reinterrogates the PC Card, updates the socket present state register (offset 08h, see Section 6.3), and re-enables the socket power control.
13	FYVCARD	W	Force YV card. Writes to this bit cause the YVCARD bit in the socket present state register (offset 08h, see Section 6.3) to be written. When set, this bit disables the socket power control.
12	FXVCARD	W	Force XV card. Writes to this bit cause the XVCARD bit in the socket present state register (offset 08h, see Section 6.3) to be written. When set, this bit disables the socket power control.
11	F3VCARD	W	Force 3-V card. Writes to this bit cause the 3VCARD bit in the socket present state register (offset 08h, see Section 6.3) to be written. When set, this bit disables the socket power control.
10	F5VCARD	W	Force 5-V card. Writes to this bit cause the 5VCARD bit in the socket present state register (offset 08h, see Section 6.3) to be written. When set, this bit disables the socket power control.
9	FBADVCCREQ	W	Force BadVccReq. Changes to the BADVCCREQ bit in the socket present state register (offset 08h, see Section 6.3) can be made by writing this bit.
8	FDATAOST	W	Force data lost. Writes to this bit cause the DATAOST bit in the socket present state register (offset 08h, see Section 6.3) to be written.
7	FNOTACARD	W	Force not a card. Writes to this bit cause the NOTACARD bit in the socket present state register (offset 08h, see Section 6.3) to be written.
6	RSVD	R	This bit returns 0 when read.
5	FCBCARD	W	Force CardBus card. Writes to this bit cause the CBCARD bit in the socket present state register (offset 08h, see Section 6.3) to be written.
4	F16BITCARD	W	Force 16-bit card. Writes to this bit cause the 16BITCARD bit in the socket present state register (offset 08h, see Section 6.3) to be written.
3	FPWRCYCLE	W	Force power cycle. Writes to this bit cause the PWREVENT bit in the socket event register (offset 00h, see Section 6.1) to be written, and the PWRCYCLE bit in the socket present state register (offset 08h, see Section 6.3) is unaffected.
2	FCDETECT2	W	Force <u>CCD2</u> . Writes to this bit cause the CD2EVENT bit in the socket event register (offset 00h, see Section 6.1) to be written, and the CDETECT2 bit in the socket present state register (offset 08h, see Section 6.3) is unaffected.
1	FCDETECT1	W	Force <u>CCD1</u> . Writes to this bit cause the CD1EVENT bit in the socket event register (offset 00h, see Section 6.1) to be written, and the CDETECT1 bit in the socket present state register (offset 08h, see Section 6.3) is unaffected.
0	FCARDSTS	W	Force CSTSCHG. Writes to this bit cause the CSTSEVENT bit in the socket event register (offset 00h, see Section 6.1) to be written. The CARDSTS bit in the socket present state register (offset 08h, see Section 6.3) is unaffected.

6.5 Socket Control Register

This register provides control of the voltages applied to the socket V_{PP} and V_{CC} . The PCI6x21/PCI6x11 controller ensures that the socket is powered up only at acceptable voltages when a CardBus card is inserted. See Table 6–6 for a complete description of the register contents.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	Socket control															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Socket control															
Type	R	R	R	R	R	R	RW	R	RW	RW	RW	RW	R	RW	RW	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Socket control**
 Offset: CardBus Socket Address + 10h
 Type: Read-only, Read/Write
 Default: 0000 0000h

Table 6–6. Socket Control Register Description

BIT	SIGNAL	TYPE	FUNCTION
31–11	RSVD	R	These bits return 0s when read.
10	RSVD	R	This bit returns 1 when read.
9–8	RSVD	R	These bits return 0s when read.
7	STOPCLK	RW	This bit controls how the CardBus clock run state machine decides when to stop the CardBus clock to the CardBus card: 0 = The CardBus $\overline{\text{CLKRUN}}$ protocol can only attempt to stop/slow the CardBus clock if the socket has been idle for 8 clocks and the PCI $\overline{\text{CLKRUN}}$ protocol is preparing to stop/slow the PCI bus clock. 1 = The CardBus $\overline{\text{CLKRUN}}$ protocol can only attempt to stop/slow the CardBus clock if the socket has been idle for 8 clocks, regardless of the state of the PCI $\overline{\text{CLKRUN}}$ signal.
6–4 †	VCCCTRL	RW	V_{CC} control. These bits are used to request card V_{CC} changes. 000 = Request power off (default) 100 = Request $V_{CC} = X.X$ V 001 = Reserved 101 = Request $V_{CC} = Y.Y$ V 010 = Request $V_{CC} = 5$ V 110 = Reserved 011 = Request $V_{CC} = 3.3$ V 111 = Reserved
3	RSVD	R	This bit returns 0 when read.
2–0 †	VPPCTRL	RW	V_{PP} control. These bits are used to request card V_{PP} changes. 000 = Request power off (default) 100 = Request $V_{PP} = X.X$ V 001 = Request $V_{PP} = 12$ V 101 = Request $V_{PP} = Y.Y$ V 010 = Request $V_{PP} = 5$ V 110 = Reserved 011 = Request $V_{PP} = 3.3$ V 111 = Reserved

† One or more bits in the register are PME context bits and can be cleared only by the assertion of $\overline{\text{GRST}}$ when $\overline{\text{PME}}$ is enabled. If $\overline{\text{PME}}$ is not enabled, then this bit is cleared by the assertion of $\overline{\text{PRST}}$ or $\overline{\text{GRST}}$.

6.6 Socket Power Management Register

This register provides power management control over the socket through a mechanism for slowing or stopping the clock on the card interface when the card is idle. See Table 6–7 for a complete description of the register contents.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	Socket power management															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Socket power management															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Socket power management**
 Offset: CardBus Socket Address + 20h
 Type: Read-only, Read/Write
 Default: 0000 0000h

Table 6–7. Socket Power Management Register Description

BIT	SIGNAL	TYPE	FUNCTION
31–26	RSVD	R	Reserved. These bits return 0s when read.
25 ‡	SKTACCES	R	Socket access status. This bit provides information on whether a socket access has occurred. This bit is cleared by a read access. 0 = No PC Card access has occurred (default). 1 = PC Card has been accessed.
24 ‡	SKTMODE	R	Socket mode status. This bit provides clock mode information. 0 = Normal clock operation 1 = Clock frequency has changed.
23–17	RSVD	R	These bits return 0s when read.
16	CLKCTRLLEN	RW	CardBus clock control enable. This bit, when set, enables clock control according to bit 0 (CLKCTRL). 0 = Clock control disabled (default) 1 = Clock control enabled
15–1	RSVD	R	These bits return 0s when read.
0	CLKCTRL	RW	CardBus clock control. This bit determines whether the CardBus <u>CLKRUN</u> protocol attempts to stop or slow the CardBus clock during idle states. The CLKCTRLLEN bit enables this bit. 0 = Allows the CardBus <u>CLKRUN</u> protocol to attempt to stop the CardBus clock (default) 1 = Allows the CardBus <u>CLKRUN</u> protocol to attempt to slow the CardBus clock by a factor of 16

‡ One or more bits in this register are cleared only by the assertion of GRST.

7 Flash Media Controller Programming Model

This section describes the internal PCI configuration registers used to program the PCI6x21/PCI6x11 flash media controller interface. All registers are detailed in the same format: a brief description for each register is followed by the register offset and a bit table describing the reset state for each register.

A bit description table, typically included when the register contains bits of more than one type or purpose, indicates bit field names, a detailed field description, and field access tags which appear in the *type* column. Table 4–1 describes the field access tags.

The PCI6x21/PCI6x11 controller is a multifunction PCI device. The flash media controller core is integrated as PCI function 3. The function 3 configuration header is compliant with the *PCI Local Bus Specification* as a standard header. Table 7–1 illustrates the configuration header that includes both the predefined portion of the configuration space and the user-definable registers.

Table 7–1. Function 3 Configuration Register Map

REGISTER NAME				OFFSET
Device ID		Vendor ID		00h
Status		Command		04h
Class code			Revision ID	08h
BIST	Header type	Latency timer	Cache line size	0Ch
Flash media base address				10h
Reserved				14h–28h
Subsystem ID ‡		Subsystem vendor ID ‡		2Ch
Reserved				30h
Reserved			PCI power management capabilities pointer	34h
Reserved				38h
Maximum latency	Minimum grant	Interrupt pin	Interrupt line	3Ch
Reserved				40h
Power management capabilities		Next item pointer	Capability ID	44h
PM data (Reserved)	PMCSR_BSE	Power management control and status ‡		48h
Reserved		General control ‡		4Ch
Subsystem access				50h
Diagnostic ‡				54h
Reserved				58h–FCh

‡ One or more bits in this register are cleared only by the assertion of GRST.

7.1 Vendor ID Register

The vendor ID register contains a value allocated by the PCI SIG and identifies the manufacturer of the PCI device. The vendor ID assigned to Texas Instruments is 104Ch.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Vendor ID															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	1	0	0	0	0	0	1	0	0	1	1	0	0

Register: **Vendor ID**
 Offset: 00h
 Type: Read-only
 Default: 104Ch

7.2 Device ID Register

The device ID register contains a value assigned to the flash media controller by Texas Instruments. The device identification for the flash media controller is 8033h.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Device ID															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	1	0	0	0	0	0	0	0	0	0	1	1	0	0	1	1

Register: **Device ID**
 Offset: 02h
 Type: Read-only
 Default: 8033h

7.3 Command Register

The command register provides control over the PCI6x21/PCI6x11 interface to the PCI bus. All bit functions adhere to the definitions in the *PCI Local Bus Specification*, as seen in the following bit descriptions. See Table 7–2 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Command															
Type	R	R	R	R	R	RW	R	RW	R	RW	R	RW	R	RW	RW	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Command**
 Offset: 04h
 Type: Read/Write, Read-only
 Default: 0000h

Table 7–2. Command Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
15–11	RSVD	R	Reserved. Bits 15–11 return 0s when read.
10	INT_DISABLE	RW	$\overline{\text{INTx}}$ disable. When set to 1, this bit disables the function from asserting interrupts on the $\overline{\text{INTx}}$ signals. 0 = $\overline{\text{INTx}}$ assertion is enabled (default) 1 = $\overline{\text{INTx}}$ assertion is disabled
9	FBB_ENB	R	Fast back-to-back enable. The flash media interface does not generate fast back-to-back transactions; therefore, bit 9 returns 0 when read.
8	SERR_ENB	RW	$\overline{\text{SERR}}$ enable. When bit 8 is set to 1, the flash media interface $\overline{\text{SERR}}$ driver is enabled. $\overline{\text{SERR}}$ can be asserted after detecting an address parity error on the PCI bus.
7	STEP_ENB	R	Address/data stepping control. The flash media interface does not support address/data stepping; therefore, bit 7 is hardwired to 0.
6	PERR_ENB	RW	Parity error enable. When bit 6 is set to 1, the flash media interface is enabled to drive $\overline{\text{PERR}}$ response to parity errors through the $\overline{\text{PERR}}$ signal.
5	VGA_ENB	R	VGA palette snoop enable. The flash media interface does not feature VGA palette snooping; therefore, bit 5 returns 0 when read.
4	MWI_ENB	RW	Memory write and invalidate enable. The flash media controller does not generate memory write invalidate transactions; therefore, bit 4 returns 0 when read.
3	SPECIAL	R	Special cycle enable. The flash media interface does not respond to special cycle transactions; therefore, bit 3 returns 0 when read.
2	MASTER_ENB	RW	Bus master enable. When bit 2 is set to 1, the flash media interface is enabled to initiate cycles on the PCI bus.
1	MEMORY_ENB	RW	Memory response enable. Setting bit 1 to 1 enables the flash media interface to respond to memory cycles on the PCI bus.
0	IO_ENB	R	I/O space enable. The flash media interface does not implement any I/O-mapped functionality; therefore, bit 0 returns 0 when read.

7.4 Status Register

The status register provides device information to the host system. All bit functions adhere to the definitions in the *PCI Local Bus Specification*, as seen in the following bit descriptions. Bits in this register may be read normally. A bit in the status register is reset when a 1 is written to that bit location; a 0 written to a bit location has no effect. See Table 7–3 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Status															
Type	RCU	RCU	RCU	RCU	RCU	R	R	RCU	R	R	R	R	RU	R	R	R
Default	0	0	0	0	0	0	1	0	0	0	0	1	0	0	0	0

Register: **Status**
 Offset: 06h
 Type: Read/Clear/Update, Read-only
 Default: 0210h

Table 7–3. Status Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
15	PAR_ERR	RCU	Detected parity error. Bit 15 is set to 1 when either an address parity or data parity error is detected.
14	SYS_ERR	RCU	Signaled system error. Bit 14 is set to 1 when \overline{SERR} is enabled and the flash media controller has signaled a system error to the host.
13	MABORT	RCU	Received master abort. Bit 13 is set to 1 when a cycle initiated by the flash media controller on the PCI bus has been terminated by a master abort.
12	TABORT_REC	RCU	Received target abort. Bit 12 is set to 1 when a cycle initiated by the flash media controller on the PCI bus was terminated by a target abort.
11	TABORT_SIG	RCU	Signaled target abort. Bit 11 is set to 1 by the flash media controller when it terminates a transaction on the PCI bus with a target abort.
10–9	PCI_SPEED	R	DEVSEL timing. Bits 10 and 9 encode the timing of \overline{DEVSEL} and are hardwired to 01b, indicating that the flash media controller asserts this signal at a medium speed on nonconfiguration cycle accesses.
8	DATAPAR	RCU	Data parity error detected. Bit 8 is set to 1 when the following conditions have been met: a. \overline{PERR} was asserted by any PCI device including the flash media controller. b. The flash media controller was the bus master during the data parity error. c. Bit 6 (PERR_EN) in the command register at offset 04h in the PCI configuration space (see Section 7.3) is set to 1.
7	FBB_CAP	R	Fast back-to-back capable. The flash media controller cannot accept fast back-to-back transactions; therefore, bit 7 is hardwired to 0.
6	UDF	R	User-definable features (UDF) supported. The flash media controller does not support the UDF; therefore, bit 6 is hardwired to 0.
5	66MHZ	R	66-MHz capable. The flash media controller operates at a maximum PCLK frequency of 33 MHz; therefore, bit 5 is hardwired to 0.
4	CAPLIST	R	Capabilities list. Bit 4 returns 1 when read, indicating that the flash media controller supports additional PCI capabilities.
3	INT_STATUS	RU	Interrupt status. This bit reflects the interrupt status of the function. Only when bit 10 (INT_DISABLE) in the command register (see Section 7.3) is a 0 and this bit is 1, is the function's \overline{INTx} signal asserted. Setting the INT_DISABLE bit to 1 has no effect on the state of this bit. This bit is set only when a valid interrupt condition exists. This bit is not set when an interrupt condition exists and signaling of that event is not enabled.
2–0	RSVD	R	Reserved. Bits 3–0 return 0s when read.

7.5 Class Code and Revision ID Register

The class code and revision ID register categorizes the base class, subclass, and programming interface of the function. The base class is 01h, identifying the controller as a mass storage controller. The subclass is 80h, identifying the function as other mass storage controller, and the programming interface is 00h. Furthermore, the T1 chip revision is indicated in the least significant byte (00h). See Table 7–4 for a complete description of the register contents.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	Class code and revision ID															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Class code and revision ID															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Class code and revision ID**
 Offset: 08h
 Type: Read-only
 Default: 0180 0000h

Table 7–4. Class Code and Revision ID Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
31–24	BASECLASS	R	Base class. This field returns 01h when read, which classifies the function as a mass storage controller.
23–16	SUBCLASS	R	Subclass. This field returns 80h when read, which specifically classifies the function as other mass storage controller.
15–8	PGMIF	R	Programming interface. This field returns 00h when read.
7–0	CHIPREV	R	Silicon revision. This field returns 00h when read, which indicates the silicon revision of the flash media controller.

7.6 Latency Timer and Class Cache Line Size Register

The latency timer and class cache line size register is programmed by host BIOS to indicate system cache line size and the latency timer associated with the flash media controller. See Table 7–5 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Latency timer and class cache line size															
Type	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Latency timer and class cache line size**
 Offset: 0Ch
 Type: Read/Write
 Default: 0000h

Table 7–5. Latency Timer and Class Cache Line Size Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
15–8	LATENCY_TIMER	RW	PCI latency timer. The value in this register specifies the latency timer for the flash media controller, in units of PCI clock cycles. When the flash media controller is a PCI bus initiator and asserts FRAME, the latency timer begins counting from zero. If the latency timer expires before the flash media transaction has terminated, then the flash media controller terminates the transaction when its $\overline{\text{GNT}}$ is deasserted.
7–0	CACHELINE_SZ	RW	Cache line size. This value is used by the flash media controller during memory write and invalidate, memory-read line, and memory-read multiple transactions.

7.7 Header Type and BIST Register

The header type and built-in self-test (BIST) register indicates the flash media controller PCI header type and no built-in self-test. See Table 7–6 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Header type and BIST															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0

Register: **Header type and BIST**
 Offset: 0Eh
 Type: Read-only
 Default: 0010h

Table 7–6. Header Type and BIST Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
15–8	BIST	R	Built-in self-test. The flash media controller does not include a BIST; therefore, this field returns 00h when read.
7–0	HEADER_TYPE	R	PCI header type. The flash media controller includes the standard PCI header. Bit 7 indicates if the flash media is a multifunction device.

7.8 Flash Media Base Address Register

The flash media base address register specifies the base address of the memory-mapped interface registers. Since the implementation of the flash media controller core in the PCI6x21/PCI6x11 controller contains 2 sockets, the size of the base address register is 8192 bytes. See Table 7–7 for a complete description of the register contents.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	Flash media base address															
Type	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Flash media base address															
Type	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Flash media base address**
 Offset: 10h
 Type: Read/Write, Read-only
 Default: 0000 0000h

Table 7–7. Flash Media Base Address Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
31–12	BAR	RW	Base address. This field specifies the upper bits of the 32-bit starting base address.
11–4	RSVD	R	Reserved. Bits 11–4 return 0s when read to indicate that the size of the base address is 8192 bytes.
3	PREFETCHABLE	R	Prefetchable. Since this base address is not prefetchable, bit 3 returns 0 when read.
2–1	RSVD	R	Reserved. Bits 2–1 return 0s when read.
0	MEM_INDICATOR	R	Memory space indicator. Bit 0 is hardwired to 0 to indicate that the base address maps into memory space.

7.9 Subsystem Vendor Identification Register

The subsystem identification register, used for system and option card identification purposes, may be required for certain operating systems. This read-only register is initialized through the EEPROM and can be written through the subsystem access register at PCI offset 50h (see Section 7.22). All bits in this register are reset by \overline{GRST} only.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Subsystem vendor identification															
Type	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Subsystem vendor identification**
 Offset: 2Ch
 Type: Read/Update
 Default: 0000h

7.10 Subsystem Identification Register

The subsystem identification register, used for system and option card identification purposes, may be required for certain operating systems. This read-only register is initialized through the EEPROM and can be written through the subsystem access register at PCI offset 50h (see Section 7.22). All bits in this register are reset by \overline{GRST} only.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Subsystem identification															
Type	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Subsystem identification**
 Offset: 2Eh
 Type: Read/Update
 Default: 0000h

7.11 Capabilities Pointer Register

The power management capabilities pointer register provides a pointer into the PCI configuration header where the power-management register block resides. Since the PCI power management registers begin at 44h, this read-only register is hardwired to 44h.

Bit	7	6	5	4	3	2	1	0
Name	Capabilities pointer							
Type	R	R	R	R	R	R	R	R
Default	0	1	0	0	0	1	0	0

Register: **Capabilities pointer**
 Offset: 34h
 Type: Read-only
 Default: 44h

7.12 Interrupt Line Register

The interrupt line register is programmed by the system and indicates to the software which interrupt line the flash media interface has assigned to it. The default value of this register is FFh, indicating that an interrupt line has not yet been assigned to the function.

Bit	7	6	5	4	3	2	1	0
Name	Interrupt line							
Type	RW	RW	RW	RW	RW	RW	RW	RW
Default	1	1	1	1	1	1	1	1

Register: **Interrupt line**
 Offset: 3Ch
 Type: Read/Write
 Default: FFh

7.13 Interrupt Pin Register

This register decodes the interrupt select inputs and returns the proper interrupt value based on Table 7–8, indicating that the flash media interface uses an interrupt. If one of the USE_INTx terminals is asserted, the interrupt select bits are ignored, and this register returns the interrupt value for the highest priority USE_INTx terminal that is asserted. If bit 28, the tie-all bit (TIEALL), in the system control register (PCI offset 80h, see Section 4.29) is set to 1, then the PCI6x21/PCI6x11 controller asserts the USE_INTA input to the flash media controller core. If bit 28 (TIEALL) in the system control register (PCI offset 80h, see Section 4.29) is set to 0, then none of the USE_INTx inputs are asserted and the interrupt for the flash media function is selected by the INT_SEL bits in the flash media general control register.

Bit	7	6	5	4	3	2	1	0
Name	Interrupt pin							
Type	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	X	X	X

Register: **Interrupt pin**
 Offset: 3Dh
 Type: Read-only
 Default: 0Xh

Table 7–8. PCI Interrupt Pin Register

INT_SEL BITS	USE_INTA	INTPIN
00	0	01h ($\overline{\text{INTA}}$)
01	0	02h ($\overline{\text{INTB}}$)
10	0	03h ($\overline{\text{INTC}}$)
11	0	04h ($\overline{\text{INTD}}$)
XX	1	01h ($\overline{\text{INTA}}$)

7.14 Minimum Grant Register

The minimum grant register contains the minimum grant value for the flash media controller core.

Bit	7	6	5	4	3	2	1	0
Name	Minimum grant							
Type	RU	RU	RU	RU	RU	RU	RU	RU
Default	0	0	0	0	0	1	1	1

Register: **Minimum grant**
 Offset: 3Eh
 Type: Read/Update
 Default: 07h

Table 7–9. Minimum Grant Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
7–0	MIN_GNT	RU	Minimum grant. The contents of this field may be used by host BIOS to assign a latency timer register value to the flash media controller. The default for this register indicates that the flash media controller may need to sustain burst transfers for nearly 64 μ s and thus request a large value be programmed in bits 15–8 of the PCI6x21/PCI6x11 latency timer and class cache line size register at offset 0Ch in the PCI configuration space (see Section 7.6).

7.15 Maximum Latency Register

The maximum latency register contains the maximum latency value for the flash media controller core.

Bit	7	6	5	4	3	2	1	0
Name	Maximum latency							
Type	RU	RU	RU	RU	RU	RU	RU	RU
Default	0	0	0	0	0	1	0	0

Register: **Maximum latency**
 Offset: 3Eh
 Type: Read/Update
 Default: 04h

Table 7–10. Maximum Latency Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
7–0	MAX_LAT	RU	Maximum latency. The contents of this field may be used by host BIOS to assign an arbitration priority level to the flash media controller. The default for this register indicates that the flash media controller may need to access the PCI bus as often as every 0.25 μ s; thus, an extremely high priority level is requested. The contents of this field may also be loaded through the serial EEPROM.

7.16 Capability ID and Next Item Pointer Registers

The capability ID and next item pointer register identifies the linked-list capability item and provides a pointer to the next capability item. See Table 7–11 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Capability ID and next item pointer															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Register: **Capability ID and next item pointer**
 Offset: 44h
 Type: Read-only
 Default: 0001h

Table 7–11. Capability ID and Next Item Pointer Registers Description

BIT	FIELD NAME	TYPE	DESCRIPTION
15–8	NEXT_ITEM	R	Next item pointer. The flash media controller supports only one additional capability, PCI power management, that is communicated to the system through the extended capabilities list; therefore, this field returns 00h when read.
7–0	CAPABILITY_ID	R	Capability identification. This field returns 01h when read, which is the unique ID assigned by the PCI SIG for PCI power-management capability.

7.17 Power Management Capabilities Register

The power management capabilities register indicates the capabilities of the flash media controller related to PCI power management. See Table 7–12 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Power management capabilities															
Type	RU	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	1	1	1	1	1	1	0	0	0	0	0	0	0	1	0

Register: **Power management capabilities**

Offset: 46h

Type: Read/Update, Read-only

Default: 7E02h

Table 7–12. Power Management Capabilities Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
15	PME_D3COLD	RU	$\overline{\text{PME}}$ support from D3 _{cold} . This bit can be set to 1 or cleared to 0 via bit 4 (D3_COLD) in the general control register at offset 4Ch in the PCI configuration space (see Section 7.21). When this bit is set to 1, it indicates that the controller is capable of generating a $\overline{\text{PME}}$ wake event from D3 _{cold} . This bit state is dependent upon the PCI6x21/PCI6x11 V _{AUX} implementation and may be configured by using bit 4 (D3_COLD) in the general control register (see Section 7.21).
14–11	PME_SUPPORT	R	$\overline{\text{PME}}$ support. This 4-bit field indicates the power states from which the flash media interface may assert $\overline{\text{PME}}$. This field returns a value of 1111b by default, indicating that $\overline{\text{PME}}$ may be asserted from the D3 _{hot} , D2, D1, and D0 power states.
10	D2_SUPPORT	R	D2 support. Bit 10 is hardwired to 1, indicating that the flash media controller supports the D2 power state.
9	D1_SUPPORT	R	D1 support. Bit 9 is hardwired to 1, indicating that the flash media controller supports the D1 power state.
8–6	AUX_CURRENT	R	Auxiliary current. This 3-bit field reports the 3.3-V _{AUX} auxiliary current requirements. When bit 15 (PME_D3COLD) is cleared, this field returns 000b; otherwise, it returns 001b. 000b = Self-powered 001b = 55 mA (3.3-V _{AUX} maximum current required)
5	DSI	R	Device-specific initialization. This bit returns 0 when read, indicating that the flash media controller does not require special initialization beyond the standard PCI configuration header before a generic class driver is able to use it.
4	RSVD	R	Reserved. Bit 4 returns 0 when read.
3	PME_CLK	R	$\overline{\text{PME}}$ clock. This bit returns 0 when read, indicating that the PCI clock is not required for the flash media controller to generate $\overline{\text{PME}}$.
2–0	PM_VERSION	R	Power-management version. This field returns 010b when read, indicating that the flash media controller is compatible with the registers described in the <i>PCI Bus Power Management Interface Specification</i> (Revision 1.1).

7.18 Power Management Control and Status Register

The power management control and status register implements the control and status of the flash media controller. This register is not affected by the internally generated reset caused by the transition from the D3_{hot} to D0 state. See Table 7–13 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Power management control and status															
Type	RCU	R	R	R	R	R	R	RW	R	R	R	R	R	R	RW	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Power management control and status**
 Offset: 48h
 Type: Read/Clear, Read/Write, Read-only
 Default: 0000h

Table 7–13. Power Management Control and Status Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
15 ‡	PME_STAT	RCU	$\overline{\text{PME}}$ status. This bit defaults to 0.
14–13	DATA_SCALE	R	This field returns 0s, because the data register is not implemented.
12–9	DATA_SELECT	R	This field returns 0s, because the data register is not implemented.
8 ‡	PME_EN	RW	$\overline{\text{PME}}$ enable. Enables $\overline{\text{PME}}$ signaling. assertion is disabled.
7–2	RSVD	R	Reserved. Bits 7–2 return 0s when read.
1–0 ‡	PWR_STATE	RW	Power state. This 2-bit field determines the current power state and sets the flash media controller to a new power state. This field is encoded as follows: 00 = Current power state is D0. 01 = Current power state is D1. 10 = Current power state is D2. 11 = Current power state is D3 _{hot} .

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

7.19 Power Management Bridge Support Extension Register

The power management bridge support extension register provides extended power-management features not applicable to the flash media controller; thus, it is read-only and returns 0 when read.

Bit	7	6	5	4	3	2	1	0
Name	Power management bridge support extension							
Type	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0

Register: **Power management bridge support extension**
 Offset: 4Ah
 Type: Read-only
 Default: 00h

7.20 Power Management Data Register

The power management bridge support extension register provides extended power-management features not applicable to the flash media controller; thus, it is read-only and returns 0 when read.

Bit	7	6	5	4	3	2	1	0
Name	Power management data							
Type	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0

Register: **Power management data**
 Offset: 4Bh
 Type: Read-only
 Default: 00h

7.21 General Control Register

The general control register provides miscellaneous PCI-related configuration. See Table 7–14 for a complete description of the register contents.

Bit	7	6	5	4	3	2	1	0
Name	General control							
Type	R	R	R	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0

Register: **General control**
 Offset: 4Ch
 Type: Read/Write, Read-only
 Default: 00h

Table 7–14. General Control Register

BIT	FIELD NAME	TYPE	DESCRIPTION
7	RSVD	R	Reserved. Bit 7 returns 0 when read.
6–5 ‡	INT_SEL	RW	Interrupt select. These bits are program the INTPIN register and set which interrupt output is used. This field is ignored if one of the USE_INTx terminals is asserted. 00 = $\overline{\text{INTA}}$ 01 = $\overline{\text{INTB}}$ 10 = $\overline{\text{INTC}}$ 11 = $\overline{\text{INTD}}$
4 ‡	D3_COLD	RW	D3 _{cold} $\overline{\text{PME}}$ support. This bit sets and clears the D3 _{cold} $\overline{\text{PME}}$ support bit in the power management capabilities register.
3	RSVD	R	Reserved. Bit 3 returns 0 when read.
2 ‡	SM_DIS	RW	SmartMedia disable. Setting this bit disables support for SmartMedia cards. The flash media controller reports a SmartMedia card as an unsupported card if this bit is set. If this bit is set, then all of the SM_SUPPORT bits in the socket enumeration register are 0.
1 ‡	MMC_SD_DIS	RW	MMC/SD disable. Setting this bit disables support for MMC/SD cards. The flash media controller reports a MMC/SD card as an unsupported card if this bit is set. If this bit is set, then all of the SD_SUPPORT bits in the socket enumeration register are 0.
0 ‡	MS_DIS	RW	Memory Stick disable. Setting this bit disables support for Memory Stick cards. The flash media controller reports a Memory Stick card as an unsupported card if this bit is set. If this bit is set, then all of the MS_SUPPORT bits in the socket enumeration register are 0.

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

7.22 Subsystem Access Register

The contents of the subsystem access register are aliased to the subsystem vendor ID and subsystem ID registers at PCI offsets 2Ch and 2Eh, respectively. See Table 7–15 for a complete description of the register contents.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	Subsystem access															
Type	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Subsystem access															
Type	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Subsystem access**
 Offset: 50h
 Type: Read/Write
 Default: 0000 0000h

Table 7–15. Subsystem Access Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
31–16	SubsystemID	RW	Subsystem device ID. The value written to this field is aliased to the subsystem ID register at PCI offset 2Eh.
15–0	SubsystemVendorID	RW	Subsystem vendor ID. The value written to this field is aliased to the subsystem vendor ID register at PCI offset 2Ch.

7.23 Diagnostic Register

This register programs the M and N inputs to the PLL and enables the diagnostic modes. The default values for M and N in this register set the PLL output to be 80 MHz, which is divided to get the 40 MHz and 20 MHz needed by the flash media cores. See Table 7–16 for a complete description of the register contents. All bits in this register are reset by GRST only.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	Diagnostic															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Diagnostic															
Type	R	R	R	R	R	R	R	R/W	R	R	R	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	1	1	0	0	0	0	0	1	0	1

Register: **Diagnostic**
 Type: Read-only, Read/Write
 Offset: 54h
 Default: 0000 0305h

Table 7–16. Diagnostic Register Description

BIT	SIGNAL	TYPE	FUNCTION
31–17	TBD_CTRL	R	PLL control bits. These bits are reserved for PLL control and test bits.
16	DIAGNOSTIC	RW	Diagnostic test bit. This test bit shortens the PLL clock CLK_VALID time and shortens the card detect debounce times for simulation and TDL.
15–11	RSVD	R	Reserved. Bits 15–11 return 0s when read.
10–8	PLL_N	RW	PLL_N input. The default value of this field is 03h.
7–5	RSVD	R	Reserved. Bits 7–5 return 0s when read.
4–0	PLL_M	RW	PLL_M input. The default value of this field is 05h.

8 SD Host Controller Programming Model

This section describes the internal PCI configuration registers used to program the PCI6x21/PCI6x11 SD host controller interface. All registers are detailed in the same format: a brief description for each register is followed by the register offset and a bit table describing the reset state for each register.

A bit description table, typically included when the register contains bits of more than one type or purpose, indicates bit field names, a detailed field description, and field access tags which appear in the *type* column. Table 4–1 describes the field access tags.

The PCI6x21/PCI6x11 controller is a multifunction PCI device. The SD host controller core is integrated as PCI function 4. The function 4 configuration header is compliant with the *PCI Local Bus Specification* as a standard header. Table 8–1 illustrates the configuration header that includes both the predefined portion of the configuration space and the user-definable registers.

Table 8–1. Function 4 Configuration Register Map

REGISTER NAME				OFFSET
Device ID		Vendor ID		00h
Status		Command		04h
Class code			Revision ID	08h
BIST	Header type	Latency timer	Cache line size	0Ch
Slot 0 base address				10h
Slot 1 base address				14h
Slot 2 base address				18h
Reserved				1Ch–28h
Subsystem ID ‡		Subsystem vendor ID ‡		2Ch
Reserved				30h
Reserved			PCI power management capabilities pointer	34h
Reserved				38h
Maximum latency	Minimum grant	Interrupt pin	Interrupt line	3Ch
Reserved			Slot information	40h
Reserved				44h–7Ch
Power management capabilities		Next item pointer	Capability ID	80h
PM data (Reserved)	PMCSR_BSE	Power management control and status ‡		84h
Reserved		General control ‡		88h
Subsystem alias				8Ch
Diagnostic ‡				90h
Reserved			Slot 0 3.3-V maximum current	94h
Reserved			Slot 1 3.3-V maximum current	98h
Reserved			Slot 2 3.3-V maximum current	9Ch
Reserved				A0h–FCh

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

8.1 Vendor ID Register

The vendor ID register contains a value allocated by the PCI SIG and identifies the manufacturer of the PCI device. The vendor ID assigned to Texas Instruments is 104Ch.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Vendor ID															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	1	0	0	0	0	0	1	0	0	1	1	0	0

Register: **Vendor ID**
 Offset: 00h
 Type: Read-only
 Default: 104Ch

8.2 Device ID Register

The device ID register contains a value assigned to the SD host controller by Texas Instruments. The device identification for the SD host controller is 8034h.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Device ID															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	1	0	0	0	0	0	0	0	0	0	1	1	0	1	0	0

Register: **Device ID**
 Offset: 02h
 Type: Read-only
 Default: 8034h

8.3 Command Register

The command register provides control over the SD host controller interface to the PCI bus. All bit functions adhere to the definitions in the *PCI Local Bus Specification*, as seen in the following bit descriptions. See Table 8–2 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Command															
Type	R	R	R	R	R	RW	R	RW	R	RW	R	RW	R	RW	RW	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Command**
 Offset: 04h
 Type: Read/Write, Read-only
 Default: 0000h

Table 8–2. Command Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
15–11	RSVD	R	Reserved. Bits 15–11 return 0s when read.
10	INT_DISABLE	RW	$\overline{\text{INTx}}$ disable. When set to 1, this bit disables the function from asserting interrupts on the $\overline{\text{INTx}}$ signals. 0 = $\overline{\text{INTx}}$ assertion is enabled (default) 1 = $\overline{\text{INTx}}$ assertion is disabled
9	FBB_ENB	R	Fast back-to-back enable. The SD host controller does not generate fast back-to-back transactions; therefore, bit 9 returns 0 when read.
8	SERR_ENB	RW	$\overline{\text{SERR}}$ enable. When bit 8 is set to 1, the SD host controller $\overline{\text{SERR}}$ driver is enabled. $\overline{\text{SERR}}$ can be asserted after detecting an address parity error on the PCI bus.
7	STEP_ENB	R	Address/data stepping control. The SD host controller does not support address/data stepping; therefore, bit 7 is hardwired to 0.
6	PERR_ENB	RW	Parity error enable. When bit 6 is set to 1, the SD host controller is enabled to drive $\overline{\text{PERR}}$ response to parity errors through the $\overline{\text{PERR}}$ signal.
5	VGA_ENB	R	VGA palette snoop enable. The SD host controller does not feature VGA palette snooping; therefore, bit 5 returns 0 when read.
4	MWI_ENB	RW	Memory write and invalidate enable. The SD host controller does not generate memory write invalidate transactions; therefore, bit 4 returns 0 when read.
3	SPECIAL	R	Special cycle enable. The SD host controller does not respond to special cycle transactions; therefore, bit 3 returns 0 when read.
2	MASTER_ENB	RW	Bus master enable. When bit 2 is set to 1, the SD host controller is enabled to initiate cycles on the PCI bus.
1	MEMORY_ENB	RW	Memory response enable. Setting bit 1 to 1 enables the SD host controller to respond to memory cycles on the PCI bus.
0	IO_ENB	R	I/O space enable. The SD host controller does not implement any I/O-mapped functionality; therefore, bit 0 returns 0 when read.

8.4 Status Register

The status register provides device information to the host system. All bit functions adhere to the definitions in the *PCI Local Bus Specification*, as seen in the following bit descriptions. Bits in this register may be read normally. A bit in the status register is reset when a 1 is written to that bit location; a 0 written to a bit location has no effect. See Table 8–3 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Status															
Type	RCU	RCU	RCU	RCU	RCU	R	R	RCU	R	R	R	R	RU	R	R	R
Default	0	0	0	0	0	0	1	0	0	0	0	1	0	0	0	0

Register: **Status**
 Offset: 06h
 Type: Read/Clear/Update, Read-only
 Default: 0210h

Table 8–3. Status Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
15	PAR_ERR	RCU	Detected parity error. Bit 15 is set to 1 when either an address parity or data parity error is detected.
14	SYS_ERR	RCU	Signaled system error. Bit 14 is set to 1 when \overline{SERR} is enabled and the SD host controller has signaled a system error to the host.
13	MABORT	RCU	Received master abort. Bit 13 is set to 1 when a cycle initiated by the SD host controller on the PCI bus has been terminated by a master abort.
12	TABORT_REC	RCU	Received target abort. Bit 12 is set to 1 when a cycle initiated by the SD host controller on the PCI bus was terminated by a target abort.
11	TABORT_SIG	RCU	Signaled target abort. Bit 11 is set to 1 by the SD host controller when it terminates a transaction on the PCI bus with a target abort.
10–9	PCI_SPEED	R	DEVSEL timing. Bits 10 and 9 encode the timing of \overline{DEVSEL} and are hardwired to 01b, indicating that the SD host controller asserts this signal at a medium speed on nonconfiguration cycle accesses.
8	DATAPAR	RCU	Data parity error detected. Bit 8 is set to 1 when the following conditions have been met: a. \overline{PERR} was asserted by any PCI device including the SD host controller. b. The SD host controller was the bus master during the data parity error. c. Bit 6 (PERR_EN) in the command register at offset 04h in the PCI configuration space (see Section 8.3) is set to 1.
7	FBB_CAP	R	Fast back-to-back capable. The SD host controller cannot accept fast back-to-back transactions; therefore, bit 7 is hardwired to 0.
6	UDF	R	User-definable features (UDF) supported. The SD host controller does not support the UDF; therefore, bit 6 is hardwired to 0.
5	66MHZ	R	66-MHz capable. The SD host controller operates at a maximum PCLK frequency of 33 MHz; therefore, bit 5 is hardwired to 0.
4	CAPLIST	R	Capabilities list. Bit 4 returns 1 when read, indicating that the SD host controller supports additional PCI capabilities.
3	INT_STATUS	RU	Interrupt status. This bit reflects the interrupt status of the function. Only when bit 10 (INT_DISABLE) in the command register (see Section 8.3) is a 0 and this bit is 1, is the function's \overline{INTx} signal asserted. Setting the INT_DISABLE bit to 1 has no effect on the state of this bit. This bit is set only when a valid interrupt condition exists. This bit is not set when an interrupt condition exists and signaling of that event is not enabled.
2–0	RSVD	R	Reserved. Bits 3–0 return 0s when read.

8.5 Class Code and Revision ID Register

The class code and revision ID register categorizes the base class, subclass, and programming interface of the function. The base class is 08h, identifying the controller as a generic system peripheral. The subclass is 05h, identifying the function as an SD host controller. The programming interface is 01h, indicating that the function is a standard SD host with DMA capabilities. Furthermore, the TI chip revision is indicated in the least significant byte (00h). See Table 8–4 for a complete description of the register contents.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	Class code and revision ID															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	1	0	0	0	0	0	0	0	0	1	0	1
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Class code and revision ID															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	X	X	X	X	X	X	X	X	X

Register: **Class code and revision ID**
 Offset: 08h
 Type: Read-only
 Default: 0805 0XXXh

Table 8–4. Class Code and Revision ID Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
31–24	BASECLASS	R	Base class. This field returns 08h when read, which broadly classifies the function as a generic system peripheral.
23–16	SUBCLASS	R	Subclass. This field returns 05h when read, which specifically classifies the function as an SD host controller.
15–8	PGMIF	R	Programming interface. If bit 0 (DMA_EN) in the general control register is 0, then this field returns 00h when read to indicate that the function is a standard SD host without DMA capabilities. If the DMA_EN bit is 1, then this field returns 01h when read to indicate that the function is a standard SD host with DMA capabilities.
7–0	CHIPREV	R	Silicon revision. This field returns the silicon revision of the SD host controller.

8.6 Latency Timer and Class Cache Line Size Register

The latency timer and class cache line size register is programmed by host BIOS to indicate system cache line size and the latency timer associated with the SD host controller. See Table 8–5 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Latency timer and class cache line size															
Type	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Latency timer and class cache line size**
 Offset: 0Ch
 Type: Read/Write
 Default: 0000h

Table 8–5. Latency Timer and Class Cache Line Size Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
15–8	LATENCY_TIMER	RW	PCI latency timer. The value in this register specifies the latency timer for the SD host controller, in units of PCI clock cycles. When the SD host controller is a PCI bus initiator and asserts FRAME, the latency timer begins counting from zero. If the latency timer expires before the SD host transaction has terminated, then the SD host controller terminates the transaction when its $\overline{\text{GNT}}$ is deasserted.
7–0	CACHELINE_SZ	RW	Cache line size. This value is used by the SD host controller during memory write and invalidate, memory-read line, and memory-read multiple transactions.

8.7 Header Type and BIST Register

The header type and built-in self-test (BIST) register indicates the SD host controller PCI header type and no built-in self-test. See Table 8–6 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Header type and BIST															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0	0	x	0	0	0	0	0	0

Register: **Header type and BIST**
 Offset: 0Eh
 Type: Read-only
 Default: 00x0h

Table 8–6. Header Type and BIST Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
15–8	BIST	R	Built-in self-test. The SD host controller does not include a BIST; therefore, this field returns 00h when read.
7–0	HEADER_TYPE	R	PCI header type. The SD host controller includes the standard PCI header. Bit 7 indicates if the SD host is a multifunction device.

8.8 SD Host Base Address Register

The SD host base address register specifies the base address of the memory-mapped interface registers for each standard SD host socket. The size of each base address register (BAR) is 256 bytes. The number of BARs is dependent on the number of SD sockets in the implementation. See Table 8–7 for a complete description of the register contents.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	SD host base address															
Type	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	SD host base address															
Type	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **SD host base address**
 Offset: 10h
 Type: Read/Write, Read-only
 Default: 0000 0000h

Table 8–7. SD host Base Address Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
31–8	BAR	RW	Base address. This field specifies the upper 24 bits of the 32-bit starting base address. The size of the base address is 256 bytes.
7–4	RSVD	R	Reserved. Bits 7–4 return 0s when read.
3	PREFETCHABLE	R	Prefetchable indicator. This bit is hardwired to 0 to indicate that the memory space is not prefetchable.
2–1	TYPE	R	This field is hardwired to 00 to indicate that the base address is located in 32-bit address space.
0	MEM_INDICATOR	R	Memory space indicator. Bit 0 is hardwired to 0 to indicate that the base address maps into memory space.

8.9 Subsystem Vendor Identification Register

The subsystem identification register, used for system and option card identification purposes, may be required for certain operating systems. This read-only register is initialized through the EEPROM and can be written through the subsystem access register at PCI offset 8Ch (see Section 8.23). All bits in this register are reset by $\overline{\text{GRST}}$ only.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Subsystem vendor identification															
Type	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Subsystem vendor identification**
 Offset: 2Ch
 Type: Read/Update
 Default: 0000h

8.10 Subsystem Identification Register

The subsystem identification register, used for system and option card identification purposes, may be required for certain operating systems. This read-only register is initialized through the EEPROM and can be written through the subsystem access register at PCI offset 8Ch (see Section 8.23). All bits in this register are reset by \overline{GRST} only.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Subsystem identification															
Type	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Subsystem identification**
 Offset: 2Eh
 Type: Read/Update
 Default: 0000h

8.11 Capabilities Pointer Register

The power management capabilities pointer register provides a pointer into the PCI configuration header where the power-management register block resides. Since the PCI power management registers begin at 80h, this read-only register is hardwired to 80h.

Bit	7	6	5	4	3	2	1	0
Name	Capabilities pointer							
Type	R	R	R	R	R	R	R	R
Default	1	0	0	0	0	0	0	0

Register: **Capabilities pointer**
 Offset: 34h
 Type: Read-only
 Default: 80h

8.12 Interrupt Line Register

The interrupt line register is programmed by the system and indicates to the software which interrupt line the SD host controller has assigned to it. The default value of this register is FFh, indicating that an interrupt line has not yet been assigned to the function.

Bit	7	6	5	4	3	2	1	0
Name	Interrupt line							
Type	RW	RW	RW	RW	RW	RW	RW	RW
Default	1	1	1	1	1	1	1	1

Register: **Interrupt line**
 Offset: 3Ch
 Type: Read/Write
 Default: FFh

8.13 Interrupt Pin Register

This register decodes the interrupt select inputs and returns the proper interrupt value based on Table 8–8, indicating that the SD host controller uses an interrupt. If one of the USE_INTx terminals is asserted, the interrupt select bits are ignored, and this register returns the interrupt value for the highest priority USE_INTx terminal that is asserted. If bit 28, the tie-all bit (TIEALL), in the system control register (PCI offset 80h, see Section 4.29) is set to 1, then the PCI6x21/PCI6x11 controller asserts the USE_INTA input to the SD host controller core. If bit 28 (TIEALL) in the system control register (PCI offset 80h, see Section 4.29) is set to 0, then none of the USE_INTx inputs are asserted and the interrupt for the SD host controller function is selected by the INT_SEL bits in the SD host general control register.

Bit	7	6	5	4	3	2	1	0
Name	Interrupt pin							
Type	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	X	X	X

Register: **Interrupt pin**
 Offset: 3Dh
 Type: Read-only
 Default: 0Xh

Table 8–8. PCI Interrupt Pin Register

INT_SEL BITS	USE_INTA	INTPIN
00	0	01h ($\overline{\text{INTA}}$)
01	0	02h ($\overline{\text{INTB}}$)
10	0	03h ($\overline{\text{INTC}}$)
11	0	04h ($\overline{\text{INTD}}$)
XX	1	01h (INTA)

8.14 Minimum Grant Register

The minimum grant register contains the minimum grant value for the SD host controller core.

Bit	7	6	5	4	3	2	1	0
Name	Minimum grant							
Type	RU	RU	RU	RU	RU	RU	RU	RU
Default	0	0	0	0	0	1	1	1

Register: **Minimum grant**
 Offset: 3Eh
 Type: Read/Update
 Default: 07h

Table 8–9. Minimum Grant Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
7–0	MIN_GNT	RU	Minimum grant. The contents of this field may be used by host BIOS to assign a latency timer register value to the SD host controller. The default for this register indicates that the SD host controller may need to sustain burst transfers for nearly 64 μ s and thus request a large value be programmed in bits 15–8 of the PCI6x21/PCI6x11 latency timer and class cache line size register at offset 0Ch in the PCI configuration space (see Section 8.6).

8.15 Maximum Latency Register

The maximum latency register contains the maximum latency value for the SD host controller core.

Bit	7	6	5	4	3	2	1	0
Name	Maximum latency							
Type	RU	RU	RU	RU	RU	RU	RU	RU
Default	0	0	0	0	0	1	0	0

Register: **Maximum latency**
 Offset: 3Fh
 Type: Read/Update
 Default: 04h

Table 8–10. Maximum Latency Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
7–0	MAX_LAT	RU	Maximum latency. The contents of this field may be used by host BIOS to assign an arbitration priority level to the SD host controller. The default for this register indicates that the SD host controller may need to access the PCI bus as often as every 0.25 μ s; thus, an extremely high priority level is requested. The contents of this field may also be loaded through the serial EEPROM.

8.16 Slot Information Register

This read-only register contains information on the number of SD sockets implemented and the base address Registers used.

Bit	7	6	5	4	3	2	1	0
Name	Slot information							
Type	R	R	R	R	R	R	R	R
Default	0	X	X	X	0	0	0	0

Register: **Maximum latency**
 Offset: 40h
 Type: Read/Update
 Default: X0h

Table 8–11. Maximum Latency Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
7	RSVD	R	Reserved. This bit returns 0 when read.
6–4	NUMBER_SLOTS	R	Number of slots. This field indicates the number of SD sockets supported by the SD host controller. Since the controller supports three SD sockets, this field returns 010 when read.
3	RSVD	R	Reserved. This bit returns 0 when read.
2–0	FIRST_BAR	R	First base address register number. This field is hardwired to 000b to indicate that the first BAR used for the SD host standard registers is BAR0.

8.17 Capability ID and Next Item Pointer Registers

The capability ID and next item pointer register identifies the linked-list capability item and provides a pointer to the next capability item. See Table 8–12 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Capability ID and next item pointer															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Register: **Capability ID and next item pointer**

Offset: 80h

Type: Read-only

Default: 0001h

Table 8–12. Capability ID and Next Item Pointer Registers Description

BIT	FIELD NAME	TYPE	DESCRIPTION
15–8	NEXT_ITEM	R	Next item pointer. The SD host controller supports only one additional capability, PCI power management, that is communicated to the system through the extended capabilities list; therefore, this field returns 00h when read.
7–0	CAPABILITY_ID	R	Capability identification. This field returns 01h when read, which is the unique ID assigned by the PCI SIG for PCI power-management capability.

8.18 Power Management Capabilities Register

The power management capabilities register indicates the capabilities of the SD host controller related to PCI power management. See Table 8–13 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Power management capabilities															
Type	RU	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	1	1	1	1	1	1	0	0	0	0	0	0	0	1	0

Register: **Power management capabilities**

Offset: 82h

Type: Read/Update, Read-only

Default: 7E02h

Table 8–13. Power Management Capabilities Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
15	PME_D3COLD	RU	$\overline{\text{PME}}$ support from D3 _{cold} . This bit can be set to 1 or cleared to 0 via bit 4 (D3_COLD) in the general control register at offset 88h in the PCI configuration space (see Section 8.22). When this bit is set to 1, it indicates that the SD host controller is capable of generating a PME wake event from D3 _{cold} . This bit state is dependent upon the SD host controller V _{AUX} implementation and may be configured by using bit 4 (D3_COLD) in the general control register (see Section 8.22).
14–11	PME_SUPPORT	R	$\overline{\text{PME}}$ support. This 4-bit field indicates the power states from which the SD host controller may assert PME. This field returns a value of 1111b by default, indicating that $\overline{\text{PME}}$ may be asserted from the D3 _{hot} , D2, D1, and D0 power states.
10	D2_SUPPORT	R	D2 support. Bit 10 is hardwired to 1, indicating that the SD host controller supports the D2 power state.
9	D1_SUPPORT	R	D1 support. Bit 9 is hardwired to 1, indicating that the SD host controller supports the D1 power state.
8–6	AUX_CURRENT	R	3.3-V _{AUX} auxiliary current requirements. This requirement is design dependent.
5	DSI	R	Device-specific initialization. This bit returns 0 when read, indicating that the SD host controller does not require special initialization beyond the standard PCI configuration header before a generic class driver is able to use it.
4	RSVD	R	Reserved. Bit 4 returns 0 when read.
3	PME_CLK	R	$\overline{\text{PME}}$ clock. This bit returns 0 when read, indicating that the PCI clock is not required for the SD host controller to generate $\overline{\text{PME}}$.
2–0	PM_VERSION	R	Power-management version. This field returns 010b when read, indicating that the SD host controller is compatible with the registers described in the <i>PCI Bus Power Management Interface Specification</i> (Revision 1.1).

8.19 Power Management Control and Status Register

The power management control and status register implements the control and status of the SD host controller. This register is not affected by the internally generated reset caused by the transition from the D3_{hot} to D0 state. See Table 8–14 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Power management control and status															
Type	RCU	R	R	R	R	R	R	RW	R	R	R	R	R	R	RW	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Power management control and status**
 Offset: 84h
 Type: Read/Clear, Read/Write, Read-only
 Default: 0000h

Table 8–14. Power Management Control and Status Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
15 ‡	PME_STAT	RCU	$\overline{\text{PME}}$ status. This bit defaults to 0.
14–13	DATA_SCALE	R	Data scale. This field returns 0s when read, because the SD host controller does not use the data register.
12–9	DATA_SELECT	R	Data select. This field returns 0s when read, because the SD host controller does not use the data register.
8 ‡	PME_EN	RW	$\overline{\text{PME}}$ enable. Enables $\overline{\text{PME}}$ signaling.
7–2	RSVD	R	Reserved. Bits 7–2 return 0s when read.
1–0 ‡	PWR_STATE	RW	Power state. This 2-bit field determines the current power state and sets the SD host controller to a new power state. This field is encoded as follows: 00 = Current power state is D0. 01 = Current power state is D1. 10 = Current power state is D2. 11 = Current power state is D3 _{hot} .

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

8.20 Power Management Bridge Support Extension Register

The power management bridge support extension register provides extended power-management features not applicable to the SD host controller; thus, it is read-only and returns 00h when read.

Bit	7	6	5	4	3	2	1	0
Name	Power management bridge support extension							
Type	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0

Register: **Power management bridge support extension**
 Offset: 86h
 Type: Read-only
 Default: 00h

8.21 Power Management Data Register

The power management bridge support extension register provides extended power-management features not applicable to the SD host controller; thus, it is read-only and returns 0 when read.

Bit	7	6	5	4	3	2	1	0
Name	Power management data							
Type	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0

Register: **Power management data**
 Offset: 87h
 Type: Read-only
 Default: 00h

8.22 General Control Register

The general control register provides miscellaneous PCI-related configuration. See Table 8–15 for a complete description of the register contents.

Bit	7	6	5	4	3	2	1	0
Name	General control							
Type	R	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0

Register: **General control**
 Offset: 88h
 Type: Read/Write, Read-only
 Default: 00h

Table 8–15. General Control Register

BIT	FIELD NAME	TYPE	DESCRIPTION
7	RSVD	R	Reserved. Bit 7 returns 0 when read.
6–5 ‡	INT_SEL	RW	Interrupt select. These bits are program the INTPIN register and set which interrupt output is used. This field is ignored if one of the USE_INTx terminals is asserted. 00 = $\overline{\text{INTA}}$ 01 = $\overline{\text{INTB}}$ 10 = $\overline{\text{INTC}}$ 11 = $\overline{\text{INTD}}$
4 ‡	D3_COLD	RW	D3 _{cold} $\overline{\text{PME}}$ support. This bit sets and clears the D3 _{cold} $\overline{\text{PME}}$ support bit in the power management capabilities register.
3–1	RSVD	R	Reserved. Bits 3–1 return 0s when read.
0 ‡	DMA_EN	RW	DMA enable. This bit enables DMA functionality of the SD host controller core. When this bit is set, the PGMIF field in the class code register returns 01h and the DMA_SUPPORT bit in the capabilities register of each SD host socket is set. When this bit is 0, the PGMIF field returns 00h and the DMA_SUPPORT bit of each SD host socket is 0.

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

8.23 Subsystem Access Register

The contents of the subsystem access register are aliased to the subsystem vendor ID and subsystem ID registers at PCI offsets 2Ch and 2Eh, respectively. See Table 8–16 for a complete description of the register contents.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	Subsystem access															
Type	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Subsystem access															
Type	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Subsystem access**
 Offset: 8Ch
 Type: Read/Write
 Default: 0000 0000h

Table 8–16. Subsystem Access Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
31–16	SubsystemID	RW	Subsystem device ID. The value written to this field is aliased to the subsystem ID register at PCI offset 2Eh.
15–0	SubsystemVendorID	RW	Subsystem vendor ID. The value written to this field is aliased to the subsystem vendor ID register at PCI offset 2Ch.

8.24 Diagnostic Register

This register enables the diagnostic modes. See Table 8–17 for a complete description of the register contents. All bits in this register are reset by GRST only.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	Diagnostic															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Diagnostic															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Diagnostic**
 Type: Read-only, Read/Write
 Offset: 90h
 Default: 0000 0000h

Table 8–17. Diagnostic Register Description

BIT	SIGNAL	TYPE	FUNCTION
31–17	RSVD	R	Reserved. Bits 31–17 return 0s when read.
16	DIAGNOSTIC	RW	Diagnostic test bit. This test bit shortens the card detect debounce times for simulation and TDL.
15–0	RSVD	R	Reserved. Bits 15–0 return 0s when read.

8.25 Slot 0 3.3-V Maximum Current Register

This register is a read/write register and the contents of this register are aliased to the 3_3_MAX_CURRENT field in the slot 0 maximum current capabilities register at offset 48h in the SD host standard registers. This register is a GRST only register.

Bit	7	6	5	4	3	2	1	0
Name	Slot 0 3.3-V maximum current							
Type	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0

Register: **Slot 3.3-V maximum current**
Type: Read/Write
Offset: 94h
Default: 0000h

8.26 Slot 1 3.3-V Maximum Current Register

This register is a read/write register and the contents of this register are aliased to the 3_3_MAX_CURRENT field in the slot 1 maximum current capabilities register at offset 48h in the SD host standard registers. This register is a GRST only register. If slot 1 is not implemented, this register is read-only and returns 0s when read.

Bit	7	6	5	4	3	2	1	0
Name	Slot 1 3.3-V maximum current							
Type	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0

Register: **Slot 1 3.3-V maximum current**
Type: Read/Write
Offset: 98h
Default: 0000h

8.27 Slot 2 3.3-V Maximum Current Register

This register is a read/write register and the contents of this register are aliased to the 3_3_MAX_CURRENT field in the slot 2 maximum current capabilities register at offset 48h in the SD host standard registers. This register is a GRST only register. If slot 2 is not implemented, this register is read-only and returns 0s when read.

Bit	7	6	5	4	3	2	1	0
Name	Slot 2 3.3-V maximum current							
Type	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0

Register: **Slot 2 3.3-V maximum current**
Type: Read/Write
Offset: 9Ch
Default: 0000h

8.28 Slot 3 3.3-V Maximum Current Register

This register is a read/write register and the contents of this register are aliased to the 3_3_MAX_CURRENT field in the slot 3 maximum current capabilities register at offset 48h in the SD host standard registers. This register is a GRST only register. If slot 3 is not implemented, this register is read-only and returns 0s when read.

Bit	7	6	5	4	3	2	1	0
Name	Slot 3 3.3-V maximum current							
Type	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0

Register: **Slot 3 3.3-V maximum current**
Type: Read/Write
Offset: A0h
Default: 0000h

8.29 Slot 4 3.3-V Maximum Current Register

This register is a read/write register and the contents of this register are aliased to the 3_3_MAX_CURRENT field in the slot 4 maximum current capabilities register at offset 48h in the SD host standard registers. This register is a GRST only register. If slot 4 is not implemented, this register is read-only and returns 0s when read.

Bit	7	6	5	4	3	2	1	0
Name	Slot 4 3.3-V maximum current							
Type	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0

Register: **Slot 4 3.3-V maximum current**
Type: Read/Write
Offset: A4h
Default: 0000h

8.30 Slot 5 3.3-V Maximum Current Register

This register is a read/write register and the contents of this register are aliased to the 3_3_MAX_CURRENT field in the slot 5 maximum current capabilities register at offset 48h in the SD host standard registers. This register is a GRST only register. If slot 5 is not implemented, this register is read-only and returns 0s when read.

Bit	7	6	5	4	3	2	1	0
Name	Slot 5 3.3-V maximum current							
Type	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0

Register: **Slot 5 3.3-V maximum current**
Type: Read/Write
Offset: A8h
Default: 0000h

9 Smart Card Controller Programming Model

This section describes the internal PCI configuration registers used to program the PCI6x21/PCI6x11 Smart Card controller interface. All registers are detailed in the same format: a brief description for each register is followed by the register offset and a bit table describing the reset state for each register.

A bit description table, typically included when the register contains bits of more than one type or purpose, indicates bit field names, a detailed field description, and field access tags which appear in the *type* column. Table 4–1 describes the field access tags.

The PCI6x21/PCI6x11 controller is a multifunction PCI device. The Smart Card controller core is integrated as PCI function 5. The function 5 configuration header is compliant with the *PCI Local Bus Specification* as a standard header. Table 9–1 illustrates the configuration header that includes both the predefined portion of the configuration space and the user-definable registers.

Table 9–1. Function 5 Configuration Register Map

REGISTER NAME				OFFSET
Device ID		Vendor ID		00h
Status		Command		04h
Class code			Revision ID	08h
BIST	Header type	Latency timer	Cache line size	0Ch
SC global control base address				10h
SC socket 0 base address				14h
SC socket 1 base address				18h
Reserved				1Ch–28h
Subsystem ID ‡		Subsystem vendor ID ‡		2Ch
Reserved				30h
Reserved			PCI power management capabilities pointer	34h
Reserved				38h
Maximum latency	Minimum grant	Interrupt pin	Interrupt line	3Ch
Reserved				40h
Power management capabilities		Next item pointer	Capability ID	44h
PM data (Reserved)	PMCSR_BSE	Power management control and status ‡		48h
Reserved		General control ‡		4Ch
Subsystem alias				50h
Class code alias				54h
Smart Card configuration 1				58h
Smart Card configuration 2				5Ch
Reserved				60h–FCh

‡ One or more bits in this register are cleared only by the assertion of GRST.

9.1 Vendor ID Register

The vendor ID register contains a value allocated by the PCI SIG and identifies the manufacturer of the PCI device. The vendor ID assigned to Texas Instruments is 104Ch.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Vendor ID															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	1	0	0	0	0	0	1	0	0	1	1	0	0

Register: **Vendor ID**
 Offset: 00h
 Type: Read-only
 Default: 104Ch

9.2 Device ID Register

The device ID register contains a value assigned to the Smart Card controller by Texas Instruments. The device identification for the Smart Card controller is 8035h.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Device ID															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	1	0	0	0	0	0	0	0	0	0	1	1	0	1	0	1

Register: **Device ID**
 Offset: 02h
 Type: Read-only
 Default: 8035h

9.3 Command Register

The command register provides control over the Smart Card controller interface to the PCI bus. All bit functions adhere to the definitions in the *PCI Local Bus Specification*, as seen in the following bit descriptions. The SERR_EN and PERR_EN enable bits in this register are internally wired-OR between other functions, and these control bits appear separately according to their software function. See Table 9–2 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Command															
Type	R	R	R	R	R	RW	R	RW	R	RW	R	R	R	R	RW	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Command**
 Offset: 04h
 Type: Read/Write, Read-only
 Default: 0000h

Table 9–2. Command Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
15–11	RSVD	R	Reserved. Bits 15–11 return 0s when read.
10	INT_DIS	RW	$\overline{\text{INTx}}$ disable. When set to 1, this bit disables the function from asserting interrupts on the $\overline{\text{INTx}}$ signals. 0 = $\overline{\text{INTx}}$ assertion is enabled (default) 1 = $\overline{\text{INTx}}$ assertion is disabled
9	FBB_EN	R	Fast back-to-back enable. The Smart Card interface does not generate fast back-to-back transactions; therefore, bit 9 returns 0 when read.
8	SER_EN	RW	System error ($\overline{\text{SERR}}$) enable. Bit 8 controls the enable for the $\overline{\text{SERR}}$ driver on the PCI interface. $\overline{\text{SERR}}$ can be asserted after detecting an address parity error on the PCI bus. Both bits 8 and 6 (PERR_EN) must be set for this function to report address parity errors. 0 = Disable $\overline{\text{SERR}}$ output driver (default) 1 = Enable $\overline{\text{SERR}}$ output driver
7	RSVD	R	Reserved. Bit 7 returns 0 when read.
6	PERR_EN	RW	Parity error response enable. Bit 6 controls this function response to parity errors through $\overline{\text{PERR}}$. Data parity errors are indicated by asserting $\overline{\text{PERR}}$, whereas address parity errors are indicated by asserting $\overline{\text{SERR}}$. 0 = This function ignores detected parity error (default) 1 = This function responds to detected parity errors
5	VGA_EN	R	VGA palette snoop enable. The Smart Card interface does not feature VGA palette snooping; therefore, bit 5 returns 0 when read.
4	MWI_EN	R	Memory write and invalidate enable. The Smart Card controller does not generate memory write invalidate transactions; therefore, bit 4 returns 0 when read.
3	SPECIAL	R	Special cycle enable. The Smart Card interface does not respond to special cycle transactions; therefore, bit 3 returns 0 when read.
2	MAST_EN	R	Bus master enable. This function is target only.
1	MEM_EN	RW	Memory space enable. This bit controls memory access. 0 = Disables this function from responding to memory space accesses (default) 1 = Enables this function to respond to memory space accesses
0	IO_EN	R	I/O space enable. The Smart Card interface does not implement any I/O-mapped functionality; therefore, bit 0 returns 0 when read.

9.4 Status Register

The status register provides device information to the host system. All bit functions adhere to the definitions in the *PCI Local Bus Specification*, as seen in the following bit descriptions. Bits in this register may be read normally. A bit in the status register is reset when a 1 is written to that bit location; a 0 written to a bit location has no effect. See Table 9–3 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Status															
Type	RCU	RCU	R	R	RCU	R	R	R	R	R	R	R	RU	R	R	R
Default	0	0	0	0	0	0	1	0	0	0	0	1	0	0	0	0

Register: **Status**
 Offset: 06h
 Type: Read/Clear/Update, Read-only
 Default: 0210h

Table 9–3. Status Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
15	PAR_ERR	RCU	Detected parity error. Bit 15 is set to 1 when either an address parity or data parity error is detected.
14	SYS_ERR	RCU	Signaled system error. Bit 14 is set to 1 when \overline{SERR} is enabled and the Smart Card controller has signaled a system error to the host.
13	MABORT	R	This function does not support bus mastering. This bit is hardwired to 0.
12	TABT_REC	R	This function does not support bus mastering and never receives a target abort. This bit is hardwired to 0.
11	TABT_SIG	RCU	Signaled target abort. Bit 11 is set to 1 by the Smart Card controller when it terminates a transaction on the PCI bus with a target abort.
10–9	PCI_SPEED	R	DEVSEL timing. Bits 10 and 9 encode the timing of \overline{DEVSEL} and are hardwired to 01b, indicating that the Smart Card controller asserts this signal at a medium speed on nonconfiguration cycle accesses.
8	DATAPAR	R	This function does not support bus mastering. This bit is hardwired to 0.
7	FBB_CAP	R	Fast back-to-back capable. The Smart Card controller cannot accept fast back-to-back transactions; therefore, bit 7 is hardwired to 0.
6	RSVD	R	Reserved. Bit 6 returns 0 when read.
5	66MHZ	R	66-MHz capable. The Smart Card controller operates at a maximum PCLK frequency of 33 MHz; therefore, bit 5 is hardwired to 0.
4	CAPLIST	R	Capabilities list. Bit 4 returns 1 when read, indicating that the Smart Card controller supports additional PCI capabilities. The linked list of PCI power-management capabilities is implemented in this function.
3	INT_STAT	RU	Interrupt status. This bit reflects the interrupt status of the function. Only when bit 10 (INT_DISABLE) in the command register (see Section 7.3) is a 0 and this bit is 1, is the function's \overline{INTx} signal asserted. Setting the INT_DISABLE bit to 1 has no effect on the state of this bit. This bit is set only when a valid interrupt condition exists. This bit is not set when an interrupt condition exists and signaling of that event is not enabled.
2–0	RSVD	R	Reserved. Bits 3–0 return 0s when read.

9.5 Class Code and Revision ID Register

The class code and revision ID register categorizes the base class, subclass, and programming interface of the function. The base class is 07h, identifying the controller as a communication device. The subclass is 80h, identifying the function as other mass storage controller, and the programming interface is 00h. Furthermore, the T1 chip revision is indicated in the least significant byte (00h). See Table 9–4 for a complete description of the register contents.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	Class code and revision ID															
Type	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU
Default	0	0	0	0	0	1	1	1	1	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Class code and revision ID															
Type	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Class code and revision ID**
 Offset: 08h
 Type: Read-only
 Default: 0780 0000h

Table 9–4. Class Code and Revision ID Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
31–24	BASECLASS	R	Base class. This field returns 07h when read, which classifies the function as a communication device.
23–16	SUBCLASS	R	Subclass. This field returns 80h when read, which specifically classifies the function as other mass storage controller.
15–8	PGMIF	R	Programming interface. This field returns 00h when read.
7–0	CHIPREV	R	Silicon revision. This field returns 00h when read, which indicates the silicon revision of the Smart Card controller.

9.6 Latency Timer and Class Cache Line Size Register

The latency timer and class cache line size register is programmed by host BIOS to indicate system cache line size and the latency timer associated with the Smart Card controller. See Table 9–5 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Latency timer and class cache line size															
Type	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Latency timer and class cache line size**
 Offset: 0Ch
 Type: Read/Write
 Default: 0000h

Table 9–5. Latency Timer and Class Cache Line Size Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
15–8	LATENCY_TIMER	RW	PCI latency timer. The value in this register specifies the latency timer for the Smart Card controller, in units of PCI clock cycles. When the Smart Card controller is a PCI bus initiator and asserts FRAME, the latency timer begins counting from zero. If the latency timer expires before the Smart Card transaction has terminated, then the Smart Card controller terminates the transaction when its $\overline{\text{GNT}}$ is deasserted.
7–0	CACHELINE_SZ	RW	Cache line size. This value is used by the Smart Card controller during memory write and invalidate, memory-read line, and memory-read multiple transactions.

9.7 Header Type and BIST Register

The header type and built-in self-test (BIST) register indicates the Smart Card controller PCI header type and no built-in self-test. See Table 9–6 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Header type and BIST															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0	x	0	0	0	0	0	0	0

Register: **Header type and BIST**
 Offset: 0Eh
 Type: Read-only
 Default: 00x0h

Table 9–6. Header Type and BIST Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
15–8	BIST	R	Built-in self-test. The Smart Card controller does not include a BIST; therefore, this field returns 00h when read.
7–0	HEADER_TYPE	R	PCI header type. The Smart Card controller includes the standard PCI header. Bit 7 indicates if the Smart Card is a multifunction device.

9.8 Smart Card Base Address Register 0

This register is used by this function to determine where to forward a memory transaction to the Smart Card global control register set. Bits 31–12 of this register are read/write and allow the base address to be located anywhere in the 32-bit PCI memory space on 4-Kbyte boundary. The window size is always 4K bytes. Bits 11–0 are read-only and always return 0s. Write transactions to these bits have no effect. Bit 3 (0b) specifies that this window is nonprefetchable. Bits 2–1 (00b) specify that this memory window can allocate anywhere in the 32-bit address space.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	Smart Card base address register 0															
Type	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Smart Card base address register 0															
Type	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Smart Card base address register 0**
 Offset: 10h
 Type: Read/Write, Read-only
 Default: 0000 0000h

9.9 Smart Card Base Address Register 1–4

Each socket has its own base address register. For example, a device supports three Smart Card sockets uses three base address registers, BA1 (socket 0), BA2 (socket 1) and BA3 (socket 2).

These registers are used by this function to determine where to forward a memory transaction to the Smart Card Control and Communication Register sets. Bits 31–12 of this register are read/write and allow the base address to be located anywhere in the 32-bit PCI memory space on 4-Kbyte boundaries and the window size is always 4K bytes. Bits 11–4 are read-only and always return 0s. Write transactions to these bits have no effect. Bit 3 (0b) specifies that these windows are nonprefetchable. Bits 2–1 (00b) specify that this memory window can allocate anywhere in the 32-bit address space.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	Smart Card base address register 1–4															
Type	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Smart Card base address register 1–4															
Type	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Smart Card base address register 1–4**
 Offset: 14h, 18h, 1Ch, and 20h
 Type: Read/Write, Read-only
 Default: 0000 0000h

9.10 Subsystem Vendor Identification Register

This register is read-update and can be modified through the subsystem vendor ID alias register. Default value is 104Ch. This default value complies with the WLP (Windows Logo Program) requirements without BIOS or EEPROM configuration. All bits in this register are reset by $\overline{\text{GRST}}$ only.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Subsystem vendor identification															
Type	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU
Default	0	0	0	1	0	0	0	0	0	1	0	0	1	1	0	0

Register: **Subsystem vendor identification**
 Offset: 2Ch
 Type: Read/Update
 Default: 104Ch

9.11 Subsystem Identification Register

This register is read-update and can be modified through the subsystem ID alias register. This register has no effect to the functionality. Default value is 8035h. This default value complies with the WLP (Windows Logo Program) requirements without BIOS or EEPROM configuration. All bits in this register are reset by GRST only.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Subsystem identification															
Type	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU	RU
Default	1	0	0	0	0	0	0	0	0	0	1	1	0	1	0	1

Register: **Subsystem identification**
 Offset: 2Eh
 Type: Read/Update
 Default: 8035h

9.12 Capabilities Pointer Register

The power management capabilities pointer register provides a pointer into the PCI configuration header where the power-management register block resides. Since the PCI power management registers begin at 44h, this read-only register is hardwired to 44h.

Bit	7	6	5	4	3	2	1	0
Name	Capabilities pointer							
Type	R	R	R	R	R	R	R	R
Default	0	1	0	0	0	1	0	0

Register: **Capabilities pointer**
 Offset: 34h
 Type: Read-only
 Default: 44h

9.13 Interrupt Line Register

The interrupt line register is programmed by the system and indicates to the software which interrupt line the Smart Card interface has assigned to it. The default value of this register is FFh, indicating that an interrupt line has not yet been assigned to the function.

Bit	7	6	5	4	3	2	1	0
Name	Interrupt line							
Type	RW	RW	RW	RW	RW	RW	RW	RW
Default	1	1	1	1	1	1	1	1

Register: **Interrupt line**
 Offset: 3Ch
 Type: Read/Write
 Default: FFh

9.14 Interrupt Pin Register

This register decodes the interrupt select inputs and returns the proper interrupt value based on Table 9–7, indicating that the Smart Card interface uses an interrupt. If one of the USE_INTx terminals is asserted, the interrupt select bits are ignored, and this register returns the interrupt value for the highest priority USE_INTx terminal that is asserted. If bit 28, the tie-all bit (TIEALL), in the system control register (PCI offset 80h, see Section 4.29) is set to 1, then the PCI6x21/PCI6x11 controller asserts the USE_INTA input to the Smart Card controller core. If bit 28 (TIEALL) in the system control register (PCI offset 80h, see Section 4.29) is set to 0, then none of the USE_INTx inputs are asserted and the interrupt for the Smart Card function is selected by the INT_SEL bits in the Smart Card general control register.

Bit	7	6	5	4	3	2	1	0
Name	Interrupt pin							
Type	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	X	X	X

Register: **Interrupt pin**
 Offset: 3Dh
 Type: Read-only
 Default: 0Xh

Table 9–7. PCI Interrupt Pin Register

INT_SEL BITS	USE_INTA	INTPIN
00	0	01h ($\overline{\text{INTA}}$)
01	0	02h ($\overline{\text{INTB}}$)
10	0	03h ($\overline{\text{INTC}}$)
11	0	04h ($\overline{\text{INTD}}$)
XX	1	01h ($\overline{\text{INTA}}$)

9.15 Minimum Grant Register

The minimum grant register contains the minimum grant value for the Smart Card controller core.

Bit	7	6	5	4	3	2	1	0
Name	Minimum grant							
Type	RU	RU	RU	RU	RU	RU	RU	RU
Default	0	0	0	0	0	1	1	1

Register: **Minimum grant**
 Offset: 3Eh
 Type: Read/Update
 Default: 07h

Table 9–8. Minimum Grant Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
7–0	MIN_GNT	RU	Minimum grant. The contents of this field may be used by host BIOS to assign a latency timer register value to the Smart Card controller. The default for this register indicates that the Smart Card controller may need to sustain burst transfers for nearly 64 μ s and thus request a large value be programmed in bits 15–8 of the PCI6x21/PCI6x11 latency timer and class cache line size register at offset 0Ch in the PCI configuration space (see Section 9.6).

9.16 Maximum Latency Register

The maximum latency register contains the maximum latency value for the Smart Card controller core.

Bit	7	6	5	4	3	2	1	0
Name	Maximum latency							
Type	RU	RU	RU	RU	RU	RU	RU	RU
Default	0	0	0	0	0	1	0	0

Register: **Maximum latency**
 Offset: 3Eh
 Type: Read/Update
 Default: 04h

Table 9–9. Maximum Latency Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
7–0	MAX_LAT	RU	Maximum latency. The contents of this field may be used by host BIOS to assign an arbitration priority level to the Smart Card controller. The default for this register indicates that the Smart Card controller may need to access the PCI bus as often as every 0.25 μ s; thus, an extremely high priority level is requested. The contents of this field may also be loaded through the serial EEPROM.

9.17 Capability ID and Next Item Pointer Registers

The capability ID and next item pointer register identifies the linked-list capability item and provides a pointer to the next capability item. See Table 9–10 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Capability ID and next item pointer															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Register: **Capability ID and next item pointer**
 Offset: 44h
 Type: Read-only
 Default: 0001h

Table 9–10. Capability ID and Next Item Pointer Registers Description

BIT	FIELD NAME	TYPE	DESCRIPTION
15–8	NEXT_ITEM	R	Next item pointer. The Smart Card controller supports only one additional capability, PCI power management, that is communicated to the system through the extended capabilities list; therefore, this field returns 00h when read.
7–0	CAPABILITY_ID	R	Capability identification. This field returns 01h when read, which is the unique ID assigned by the PCI SIG for PCI power-management capability.

9.18 Power Management Capabilities Register

The power management capabilities register indicates the capabilities of the Smart Card controller related to PCI power management. See Table 9–11 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Power management capabilities															
Type	RU	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	1	1	1	1	1	1	0	0	0	0	0	0	0	1	0

Register: **Power management capabilities**

Offset: 46h

Type: Read/Update, Read-only

Default: 7E02h

Table 9–11. Power Management Capabilities Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
15	PME_D3COLD	RU	$\overline{\text{PME}}$ support from D3 _{cold} . This bit can be set to 1 or cleared to 0 via bit 4 (D3_COLD) in the general control register at offset 4Ch in the PCI configuration space (see Section 9.22). When this bit is set to 1, it indicates that the controller is capable of generating a $\overline{\text{PME}}$ wake event from D3 _{cold} . This bit state is dependent upon the PCI6x21/PCI6x11 V _{AUX} implementation and may be configured by using bit 4 (D3_COLD) in the general control register (see Section 9.22).
14	PME_D3HOT	R	$\overline{\text{PME}}$ support. This 4-bit field indicates the power states from which the Smart Card interface may assert $\overline{\text{PME}}$. This field returns a value of 1111b by default, indicating that $\overline{\text{PME}}$ may be asserted from the D3 _{hot} , D2, D1, and D0 power states.
13	PME_D2	R	
12	PME_D1	R	
11	PME_D0	R	
10	D2_SUPPORT	R	D2 support. Bit 10 is hardwired to 1, indicating that the Smart Card controller supports the D2 power state.
9	D1_SUPPORT	R	D1 support. Bit 9 is hardwired to 1, indicating that the Smart Card controller supports the D1 power state.
8–6	AUX_CURRENT	R	Auxiliary current. This 3-bit field reports the 3.3-V _{AUX} auxiliary current requirements. When bit 15 (PME_D3COLD) is cleared, this field returns 000b; otherwise, it returns 001b. 000b = Self-powered 001b = 55 mA (3.3-V _{AUX} maximum current required)
5	DSI	R	Device-specific initialization. This function requires device-specific initialization.
4	RSVD	R	Reserved. Bit 4 returns 0 when read.
3	PME_CLK	R	$\overline{\text{PME}}$ clock. This bit returns 0 when read, indicating that the PCI clock is not required for the Smart Card controller to generate $\overline{\text{PME}}$.
2–0	PM_VERSION	R	Power-management version. This field returns 010b when read, indicating that the Smart Card controller is compatible with the registers described in the <i>PCI Bus Power Management Interface Specification</i> (Revision 1.1).

9.19 Power Management Control and Status Register

The power management control and status register implements the control and status of the Smart Card controller. This register is not affected by the internally generated reset caused by the transition from the D3_{hot} to D0 state. See Table 9–12 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Power management control and status															
Type	RCU	R	R	R	R	R	R	RW	R	R	R	R	R	R	RW	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Power management control and status**
 Offset: 48h
 Type: Read/Clear/Update, Read/Write, Read-only
 Default: 0000h

Table 9–12. Power Management Control and Status Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
15 ‡	PME_STAT	RCU	$\overline{\text{PME}}$ status. This bit is set when the function would normally assert the $\overline{\text{PME}}$ signal independent of the state of PME_EN bit. Writing a 1 to this bit clears it and causes the function to stop asserting a $\overline{\text{PME}}$ (if enabled). Writing a 0 has no effect. This bit is initialized by GRST only when the PME_D3cold bit is 1.
14–9	RSVD	R	Reserved. Bits 14–9 return 0s when read.
8 ‡	PME_EN	RW	$\overline{\text{PME}}$ enable. This bit is initialized by GRST only when PME_D3cold bit is 1.
7–2	RSVD	R	Reserved. Bits 7–2 return 0s when read.
1–0 ‡	DSTATE	RW	Device State: This bit field controls device power management state. Invalid state assignments are ignored. (ex. Current state 10b → writing 01b. This is rejected and stays 10b. See the latest <i>PCI Local Bus Specification</i> .) This bit field is initialized by GRST only when PME_D3cold bit is 1.

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

9.20 Power Management Bridge Support Extension Register

The power management bridge support extension register provides extended power-management features not applicable to the Smart Card controller; thus, it is read-only and returns 0 when read.

Bit	7	6	5	4	3	2	1	0
Name	Power management bridge support extension							
Type	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0

Register: **Power management bridge support extension**
 Offset: 4Ah
 Type: Read-only
 Default: 00h

9.21 Power Management Data Register

The power management bridge support extension register provides extended power-management features not applicable to the Smart Card controller; thus, it is read-only and returns 0 when read.

Bit	7	6	5	4	3	2	1	0
Name	Power management data							
Type	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0

Register: **Power management data**
 Offset: 4Bh
 Type: Read-only
 Default: 00h

9.22 General Control Register

This register controls this function. Information of this register can be read from the socket configuration register in the Smart Card socket control register set. See Table 9–13 for a complete description of the register contents.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	General control															
Type	R	R	R	R	R	R	R	R	R	RW	RW	RW	R	R	R	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **General control**
 Offset: 4Ch
 Type: Read/Write (EEPROM, $\overline{\text{GRST}}$ only)
 Default: 0000h

Table 9–13. General Control Register

BIT	FIELD NAME	TYPE	DESCRIPTION
15–7	RSVD	R	Reserved. Bits 15–7 return 0s when read.
6–5 ‡	INT_SEL	RW	Interrupt select. These bits are program the INTPIN register and set which interrupt output is used. This field is ignored if one of the USE_INTx terminals is asserted. 00 = $\overline{\text{INTA}}$ (pin = 1) 01 = $\overline{\text{INTB}}$ (pin = 2) 10 = $\overline{\text{INTC}}$ (pin = 3) 11 = $\overline{\text{INTD}}$ (pin = 4)
4 ‡	D3_COLD	RW	Disable function. Setting this bit to 1 hides this function. PCI configuration register of this function must be accessible at any time. Clock (PCI and 48 MHz) to the rest of the function blocks must be gated to reduce power consumption.
3–0	RSVD	R	Reserved. Bits 3–0 return 0s when read.

‡ One or more bits in this register are cleared only by the assertion of $\overline{\text{GRST}}$.

9.23 Subsystem ID Alias Register

The contents of the subsystem access register are aliased to the subsystem vendor ID and subsystem ID registers at PCI offsets 2Ch and 2Eh, respectively. See Table 9–14 for a complete description of the register contents.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	Subsystem ID alias															
Type	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW
Default	1	0	0	0	0	0	0	0	0	0	1	1	0	1	0	1
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Subsystem ID alias															
Type	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	1	0	0	0	0	0	1	0	0	1	1	0	0

Register: **Subsystem ID alias**
 Offset: 50h
 Type: Read/Write (EEPROM, $\overline{\text{GRST}}$ only)
 Default: 8035 104Ch

Table 9–14. Subsystem ID Alias Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
31–16	SubsystemID	RW	Subsystem device ID. The value written to this field is aliased to the subsystem ID register at PCI offset 2Eh.
15–0	SubsystemVendorID	RW	Subsystem vendor ID. The value written to this field is aliased to the subsystem vendor ID register at PCI offset 2Ch.

9.24 Class Code Alias Register

This register is alias of the class code. Not like original register, this register is read/write and loadable from EEPROM.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	Class code alias															
Type	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	1	1	1	1	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Class code alias															
Type	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Class code alias**
 Offset: 54h
 Type: Read-only, Read/Write (EEPROM, $\overline{\text{GRST}}$ only)
 Default: 0780 0000h

9.25 Smart Card Configuration 1 Register

BIOS or EEPROM configure system dependent Smart Card interface information through this register. Information of this register can be read from the Smart Card configuration 1 alias register in the Smart Card global control register set. The software utilizes this information and adjusts the software and firmware behavior if necessary. Corresponding bits are tied to 0 if the socket is not implemented.

Class A and B support are depend on the system and integrated device. Supporting both classes requires method (pins) to control 5.0 V and 3.0 V.

Default value and bit types are depending on the device. When this core is integrated into a device and does not have all four sockets, removed sockets bits must be tied to 0 and changed to read-only bits.

See Table 9–15 for a complete description of the register contents. All bits in this register are reset by $\overline{\text{GRST}}$ only.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	Smart Card configuration 1															
Type	RW	RW	RW	RW	R	RW	RW	RW	R	RW	RW	RW	R	RW	RW	RW
Default	0	0	0	0	0	0	1	1	0	1	1	1	0	1	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Smart Card configuration 1															
Type	R	RW	RW	RW	R	R	R	R	R	RW	RW	RW	R	RW	RW	RW
Default	0	0	1	1	0	0	1	1	0	0	0	0	0	1	1	1

Register: **Smart Card configuration 1**
 Offset: 58h
 Type: Read/Write, Read-only (EEPROM, $\overline{\text{GRST}}$ only)
 Default: 0374 3307h

Table 9–15. Smart Card Configuration 1 Register Description

BIT	FIELD NAME	TYPE	DESCRIPTION
31–28	SCRATCH_PAD	RW	Scratch pad
27	CLASS_B_SKT3	R	Socket 3 Class B Smart Card support. Since socket 3 is not implemented in the controller, this bit is a read-only 0.
26	CLASS_B_SKT2	RW	Socket 2 Class B Smart Card support. Since socket 2 is not implemented in the controller, this bit is a read-only 0.
25	CLASS_B_SKT1	RW	Socket 1 Class B Smart Card support. When this bit is set to 1, socket 1 supports Class B Smart Cards.
24	CLASS_B_SKT0	RW	Socket 0 Class B Smart Card support. When this bit is set to 1, socket 0 supports Class B Smart Cards.
23	CLASS_A_SKT3	R	Socket 3 Class A Smart Card support. Since socket 3 is not implemented in the controller, this bit is a read-only 0.
22	CLASS_A_SKT2	RW	Socket 2 Class A Smart Card support. Since socket 2 is not implemented in the controller, this bit is a read-only 0.
21	CLASS_A_SKT1	RW	Socket 1 Class A Smart Card support. When this bit is set to 1, socket 1 supports Class A Smart Cards.
20	CLASS_A_SKT0	RW	Socket 0 Class A Smart Card support. When this bit is set to 1, socket 0 supports Class A Smart Cards.
19	EMVIF_EN_SKT3	R	Socket 3 EMV interface enable. Since socket 3 is not implemented in the controller, this bit is a read-only 0.
18	EMVIF_EN_SKT2	RW	Socket 2 EMV interface enable. Since socket 2 is not implemented in the controller, this bit is a read-only 0.
17	EMVIF_EN_SKT1	RW	Socket 1 EMV interface enable. When this bit is set to 1, the internal EVM interface for socket 1 is enabled.
16	EMVIF_EN_SKT0	RW	Socket 0 EMV interface enable. When this bit is set to 1, the internal EVM interface for socket 0 is enabled.
15	GPIO_EN_SKT3	R	Socket 3 GPIO enable. Since socket 3 is not implemented in the controller, this bit is a read-only 0.
14	GPIO_EN_SKT2	RW	Socket 2 GPIO enable. Since socket 2 is not implemented in the controller, this bit is a read-only 0.
13	GPIO_EN_SKT1	RW	Socket 1 GPIO enable. When this bit is set to 1, the SC_GPIOs for socket 1 are enabled.
12	GPIO_EN_SKT0	RW	Socket 0 GPIO enable. When this bit is set to 1, the SC_GPIOs for socket 0 are enabled.
11	PCMCIA_MODE_SKT3	R	Socket 3 PCMCIA mode. Since socket 3 is not implemented in the controller, this bit is a read-only 0.
10	PCMCIA_MODE_SKT2	R	Socket 2 PCMCIA mode. Since socket 2 is not implemented in the controller, this bit is a read-only 0.
9	PCMCIA_MODE_SKT1	R	Socket 1 PCMCIA mode. Since socket 1 is implemented as a dedicated socket in the controller, this bit returns 1 when read.
8	PCMCIA_MODE_SKT0	R	Socket 0 PCMCIA mode. Since socket 0 is implemented as a dedicated socket in the controller, this bit returns 1 when read.
7	PME_SUPPORT_SKT3	R	Socket 3 PME support. Since socket 3 is not implemented in the controller, this bit is a read-only 0.
6	PME_SUPPORT_SKT2	RW	Socket 2 PME support. Since socket 2 is not implemented in the controller, this bit is a read-only 0.
5	PME_SUPPORT_SKT1	RW	Socket 1 PME support. When this bit is set to 1, socket 1 card insertions cause a PME event.
4	PME_SUPPORT_SKT0	RW	Socket 0 PME support. When this bit is set to 1, socket 0 card insertions cause a PME event.
3	SKT3_EN	R	Socket 3 enable. Since socket 3 is not implemented in the controller, this bit is a read-only 0.
2	SKT2_EN	RW	Socket 2 enable. Since socket 2 is not implemented in the controller, this bit is a read-only 0.
1	SKT1_EN	RW	Socket 1 enable. When this bit is set to 1, socket 1 is enabled.
0	SKT0_EN	RW	Socket 0 enable. When this bit is set to 1, socket 0 is enabled.

9.26 Smart Card Configuration 2 Register

BIOS or EEPROM configure system dependent Smart Card interface information through this register. Information of this register can be read from the Smart Card configuration 2 alias in the Smart Card global control register set. The software utilizes this information and adjusts the software and firmware behavior, if necessary.

See Table 9–16 for a complete description of the register contents. All bits in this register are reset by $\overline{\text{GRST}}$ only.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	Smart Card configuration 2															
Type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	Smart Card configuration 2															
Type	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Register: **Smart Card Configuration 2**
 Offset: 54h
 Type: Read-only, Read/Write (EEPROM, $\overline{\text{GRST}}$ only)
 Default: 0000 0000h

Table 9–16. Smart Card Configuration 2 Register Description

BIT	SIGNAL	TYPE	FUNCTION
31–16	RSVD	R	Reserved. Bits 31–16 return 0s when read.
15–8	PWRUP_DELAY_PCMCIA	R	Power up delay for the PCMCIA socket. This register indicates how long the external power switch takes to apply stable power to the PCMCIA socket in ms. Software must wait before starting operation after power up. This field has no effect for the hardware.
7–0	RSVD	R	Reserved. Bits 7–0 return 0s when read.

10 Electrical Characteristics

10.1 Absolute Maximum Ratings Over Operating Temperature Ranges†

Supply voltage range, VR_PORT	-0.2 V to 2.2 V
ANALOGV _{CC}	-0.3 V to 4 V
V _{CC}	-0.3 V to 4 V
PLL _{VCC}	-0.3 V to 4 V
V _{CCCB}	-0.5 V to 5.5 V
V _{CCP}	-0.5 V to 5.5 V
Clamping voltage range, V _{CCP} and V _{CCCB}	-0.5 V to 6 V
Input voltage range, V _I : PCI, CardBus, PHY, miscellaneous	-0.5 V to V _{CC} + 0.5 V
Output voltage range, V _O : PCI, CardBus, PHY, miscellaneous	-0.5 V to V _{CC} + 0.5 V
Input clamp current, I _{IK} (V _I < 0 or V _I > V _{CC}) (see Note 1)	±20 mA
Output clamp current, I _{OK} (V _O < 0 or V _O > V _{CC}) (see Note 2)	±20 mA
Human Body Model (HBM) ESD performance	1500 V
Operating free-air temperature, T _A	0°C to 70°C
Storage temperature range, T _{stg}	-65°C to 150°C
Virtual junction temperature, T _J	150°C

† Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

- NOTES:
1. Applies for external input and bidirectional buffers. V_I > V_{CC} does not apply to fail-safe terminals. PCI terminals and miscellaneous terminals are measured with respect to V_{CCP} instead of V_{CC}. PC Card terminals are measured with respect to CardBus V_{CC}. The limit specified applies for a dc condition.
 2. Applies for external output and bidirectional buffers. V_O > V_{CC} does not apply to fail-safe terminals. PCI terminals and miscellaneous terminals are measured with respect to V_{CCP} instead of V_{CC}. PC Card terminals are measured with respect to CardBus V_{CC}. The limit specified applies for a dc condition.

10.2 Recommended Operating Conditions (see Note 3)

	OPERATION	MIN	NOM	MAX	UNIT
VR_PORT (see Table 2-4 for description)	1.8 V	1.6	1.8	2	V
ANALOGV _{CC}	3.3 V	3	3.3	3.6	V
V _{CC}	3.3 V	3	3.3	3.6	V
PLL _{VCC}	3.3 V	3	3.3	3.6	V
V _{CCP} PCI and miscellaneous I/O clamp voltage	3.3 V	3	3.3	3.6	V
	5 V	4.75	5	5.25	
V _{CCCB} PC Card I/O clamp voltage	3.3 V	3	3.3	3.6	V
	5 V	4.75	5	5.25	

NOTE 3: Unused terminals (input or I/O) must be held high or low to prevent them from floating.

Recommended Operating Conditions (continued)

		OPERATION	MIN	NOM	MAX	UNIT
V_{IH}^{\dagger}	High-level input voltage	PCI	3.3 V		V_{CCP}	V
			5 V	2	V_{CCP}	
	PC Card	PC Card	3.3 V CardBus	$0.475 V_{CC(A/B)}$	$V_{CC(A/B)}$	V
			3.3 V 16-bit	2	$V_{CC(A/B)}$	V
			5 V 16-bit	2.4	$V_{CC(A/B)}$	V
	PC(0–2)		$0.7 V_{CC}$	V_{CC}	V	
Miscellaneous [‡]		2	V_{CC}	V		
V_{IL}^{\dagger}	Low-level input voltage	PCI	3.3 V	0	$0.3 V_{CCP}$	V
			5 V	0	0.8	
	PC Card	PC Card	3.3 V CardBus	0	$0.325 V_{CC(A/B)}$	V
			3.3 V 16-bit	0	0.8	V
			5 V 16-bit	0	0.8	V
	PC(0–2)		0	$0.2 V_{CC}$	V	
Miscellaneous [‡]		0	0.8	V		
V_I	Input voltage	PCI	0	V_{CCP}	V	
		PC Card	0	V_{CCCB}		
		Miscellaneous [‡]	0	V_{CC}		
V_O^{\S}	Output voltage	PCI	0	V_{CC}	V	
		PC Card	0	V_{CC}		
		Miscellaneous [‡]	0	V_{CC}		
t_t	Input transition time (t_r and t_f)	PCI and PC Card	1	4	ns	
		Miscellaneous [‡]	0	6		
I_O	Output current	TPBIAS outputs	-5.6	1.3	mA	
V_{ID}	Differential input voltage	Cable inputs during data reception		118	260	mV
		Cable inputs during arbitration		168	265	
V_{IC}	Common-mode input voltage	TPB cable inputs, source power node		0.4706	2.515	V
		TPB cable inputs, nonsource power node		0.4706	2.015 [¶]	
t_{PU}	Powerup reset time	GRST [‡] input	2		ms	
	Receive input jitter	TPA, TPB cable inputs	S100 operation		± 1.08	ns
			S200 operation		± 0.5	
			S400 operation		± 0.315	
	Receive input skew	Between TPA and TPB cable inputs	S100 operation		± 0.8	ns
			S200 operation		± 0.55	
			S400 operation		± 0.5	
T_A	Operating ambient temperature range		0	25	70	°C
$T_{J\#}$	Virtual junction temperature		0	25	115	°C

[†] Applies to external inputs and bidirectional buffers without hysteresis

[‡] Miscellaneous terminals are 1, 2, 12, 17, 111, 112, 125, 167, 181, and 187 for the PDV packaged device and B10, C09, D01, E03, F12, G03, H02, L17, P17, and P18 for the GHK packaged device (CNA, SCL, SDA, SUSPEND, GRST, CDx, PHY_TEST_MA, and VSx terminals).

[§] Applies to external output buffers

[¶] For a node that does not source power, see Section 4.2.2.2 in IEEE Std 1394a–2000.

[#] These junction temperatures reflect simulation conditions. The customer is responsible for verifying junction temperature.

10.3 Electrical Characteristics Over Recommended Operating Conditions (unless otherwise noted)

PARAMETER		TERMINALS	OPERATION	TEST CONDITIONS	MIN	MAX	UNIT
V _{OH}	High-level output voltage	PCI	3.3 V	I _{OH} = -0.5 mA	0.9 V _{CC}		V
			5 V	I _{OH} = -2 mA	2.4		
		PC Card	3.3 V CardBus	I _{OH} = -0.15 mA	0.9 V _{CC}		V
			3.3 V 16-bit	I _{OH} = -0.15 mA	2.4		
			5 V 16-bit	I _{OH} = -0.15 mA	2.8		
Miscellaneous [§]		I _{OH} = -4 mA	V _{CC} -0.6				
V _{OL}	Low-level output voltage	PCI	3.3 V	I _{OL} = 1.5 mA		0.1 V _{CC}	V
			5 V	I _{OL} = 6 mA		0.55	
		PC Card	3.3 V CardBus	I _{OL} = 0.7 mA		0.1 V _{CC}	
			3.3 V 16-bit	I _{OL} = 0.7 mA		0.4	
			5 V 16-bit	I _{OL} = 0.7 mA		0.55	
Miscellaneous [§]		I _{OL} = 4 mA		0.5			
I _{OZ}	3-state output high-impedance	Output terminals	3.6 V	V _O = V _{CC} or GND		±20	μA
I _{OZL}	High-impedance, low-level output current	Output terminals	3.6 V	V _I = V _{CC}		-1	μA
			5.25 V	V _I = V _{CC}		-1	
I _{OZH}	High-impedance, high-level output current	Output terminals	3.6 V	V _I = V _{CC} [†]		10	μA
			5.25 V	V _I = V _{CC} [†]		25	
I _{IL}	Low-level input current	Input terminals	3.6 V	V _I = GND		±20	μA
		I/O terminals	3.6 V	V _I = GND		±20	
I _{IH}	High-level input current	PCI	3.6 V	V _I = V _{CC} [‡]		±20	μA
		Others	3.6 V	V _I = V _{CC} [‡]		±20	
		Input terminals	3.6 V	V _I = V _{CC} [‡]		10	
			5.25 V	V _I = V _{CC} [‡]		20	
		I/O terminals	3.6 V	V _I = V _{CC} [‡]		10	
			5.25 V	V _I = V _{CC} [‡]		25	

[†] For PCI and miscellaneous terminals, V_I = V_{CCP}. For PC Card terminals, V_I = V_{CC(A/B)}.

[‡] For I/O terminals, input leakage (I_{IL} and I_{IH}) includes I_{OZ} leakage of the disabled output.

[§] Miscellaneous terminals are 1, 2, 12, 17, 111, 112, 125, 167, 181, and 187 for the PDV packaged device and B10, C09, D01, E03, F12, G03, H02, L17, P17, and P18 for the GHK packaged device (CNA, SCL, SDA, SUSPEND, GRST, CDx, PHY_TEST_MA, and VSx terminals).

10.4 Electrical Characteristics Over Recommended Ranges of Operating Conditions (unless otherwise noted)

10.4.1 Device

PARAMETER		TEST CONDITION	MIN	MAX	UNIT
V _{TH}	Power status threshold, CPS input [†]	400-kΩ resistor [†]	4.7	7.5	V
V _O	TPBIAS output voltage	At rated I _O current	1.665	2.015	V
I _I	Input current (PC0–PC2 inputs)	V _{CC} = 3.6 V		5	μA

[†] Measured at cable power side of resistor.

10.4.2 Driver

PARAMETER		TEST CONDITION	MIN	MAX	UNIT
V _{OD}	Differential output voltage	56 Ω, See Figure 10–1	172	265	mV
I _{DIFF}	Driver difference current, TPA+, TPA–, TPB+, TPB–	Drivers enabled, speed signaling off	–1.05†	1.05†	mA
I _{SP200}	Common-mode speed signaling current, TPB+, TPB–	S200 speed signaling enabled	–4.84‡	–2.53‡	mA
I _{SP400}	Common-mode speed signaling current, TPB+, TPB–	S400 speed signaling enabled	–12.4‡	–8.10‡	mA
V _{OFF}	Off state differential voltage	Drivers disabled, See Figure 10–1		20	mV

† Limits defined as algebraic sum of TPA+ and TPA– driver currents. Limits also apply to TPB+ and TPB– algebraic sum of driver currents.

‡ Limits defined as absolute limit of each of TPB+ and TPB– driver currents.

Figure 10–1. Test Load Diagram

10.4.3 Receiver

PARAMETER		TEST CONDITION	MIN	TYP	MAX	UNIT
Z _{ID}	Differential impedance	Drivers disabled	4	7		kΩ
					4	μF
Z _{IC}	Common-mode impedance	Drivers disabled	20			kΩ
					24	μF
V _{TH–R}	Receiver input threshold voltage	Drivers disabled	–30		30	mV
V _{TH–CB}	Cable bias detect threshold, TPBx cable inputs	Drivers disabled	0.6		1.0	V
V _{TH+}	Positive arbitration comparator threshold voltage	Drivers disabled	89		168	mV
V _{TH–}	Negative arbitration comparator threshold voltage	Drivers disabled	–168		–89	mV
V _{TH–SP200}	Speed signal threshold	TPBIAS–TPA common mode voltage, drivers disabled	49		131	mV
V _{TH–SP400}	Speed signal threshold		314		396	mV

10.5 PCI Clock/Reset Timing Requirements Over Recommended Ranges of Supply Voltage and Operating Free-Air Temperature

PARAMETER		ALTERNATE SYMBOL	TEST CONDITIONS	MIN	MAX	UNIT
t _c	Cycle time, PCLK	t _{cyc}		30		ns
t _{w(H)}	Pulse duration (width), PCLK high	t _{high}		11		ns
t _{w(L)}	Pulse duration (width), PCLK low	t _{low}		11		ns
t _r , t _f	Slew rate, PCLK	Δv/Δt		1	4	V/ns
t _w	Pulse duration (width), GRST	t _{rst}		1		ms
t _{su}	Setup time, PCLK active at end of PRST	t _{rst-clk}		100		μs

10.6 Switching Characteristics for PHY Port Interface

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Jitter, transmit		Between TPA and TPB			±0.15	ns
Skew, transmit		Between TPA and TPB			±0.10	ns
t_r	TP differential rise time, transmit	10% to 90%, at 1394 connector	0.5		1.2	ns
t_f	TP differential fall time, transmit	90% to 10%, at 1394 connector	0.5		1.2	ns

10.7 Operating, Timing, and Switching Characteristics of XI

PARAMETER		MIN	TYP	MAX	UNIT
V_{DD}		3.0	3.3	3.6	V (PLL V_{CC})
V_{IH}	High-level input voltage	0.63 V_{CC}			V
V_{IL}	Low-level input voltage	0.33 V_{CC}			V
Input clock frequency		24.576			MHz
Input clock frequency tolerance		<100			PPM
Input slew rate		0.2		4	V/ns
Input clock duty cycle		40%		60%	

10.8 PCI Timing Requirements Over Recommended Ranges of Supply Voltage and Operating Free-Air Temperature

This data manual uses the following conventions to describe time (t) intervals. The format is t_A , where *subscript A* indicates the type of dynamic parameter being represented. One of the following is used: t_{pd} = propagation delay time, t_d (t_{en} , t_{dis}) = delay time, t_{su} = setup time, and t_h = hold time.

PARAMETER		ALTERNATE SYMBOL	TEST CONDITIONS	MIN	MAX	UNIT
t_{pd}	PCLK-to-shared signal valid delay time	t_{val}	$C_L = 50$ pF, See Note 4		11	ns
	PCLK-to-shared signal invalid delay time	t_{inv}		2		
t_{en}	Enable time, high impedance-to-active delay time from PCLK	t_{on}		2		ns
t_{dis}	Disable time, active-to-high impedance delay time from PCLK	t_{off}			28	ns
t_{su}	Setup time before PCLK valid	t_{su}		7		ns
t_h	Hold time after PCLK high	t_h		0		ns

NOTE 4: PCI shared signals are AD31–AD0, C/BE3–C/BE0, FRAME, TRDY, IRDY, STOP, IDSEL, DEVSEL, and PAR.

11 Mechanical Information

The PCI6x21/PCI6x11 device is available in the 288-terminal MicroStar BGA™ package (GHK) or the 288-terminal lead (Pb atomic number 82) free MicroStar BGA™ package (ZHK). The following figure shows the mechanical dimensions for the GHK package. The GHK and ZHK packages are mechanically identical; therefore, only the GHK mechanical drawing is shown.

GHK (S-PBGA-N288)

PLASTIC BALL GRID ARRAY

- NOTES: A. All linear dimensions are in millimeters.
 B. This drawing is subject to change without notice.
 C. MicroStar BGA™ configuration.

MicroStar BGA is a trademark of Texas Instruments.
