Storage Temperature .....	-65°C to +150°C
Ambient Temperature with Power Applied .....	-40°C to +85°C
Supply Voltage Range .....	-0.5V to +4.6V
DC Input Voltage .....	-0.5V to +4.6V

**Note:**

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

### Electrical Characteristics ( $V_{CC} = 3.0\text{V}$ to $3.6\text{V}$ , $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$ )

Parameters	Description	Test Conditions	Com.		Units
			Min.	Max.	
$t_{PLH}$	Propagation Delay $A_X$ to $B_X$	$C_L = 50\text{pF}, R_L = 500\Omega$		250	ps
$t_{EN}^{(3)}$	Bus Enable	$C_L = 50\text{pF}$ $R_L = 500\Omega$ $R = 500\Omega$	1	4.5	ns
$t_{DIS}^{(3)}$	Bus Disable		1	5.0	
$t_M$	Make-before-break time		0	2	

**Notes:**

1. This parameter is guaranteed but not tested on Propagation Delays.
2. The bus switch contributes no propagational delay other than the RC delay of the On-Resistance of the switch and the load capacitance. The time constant for the switch alone is of the order of 0.25ns for 50pF load. Since this time constant is much smaller than the rise/fall times of typical driving signals, it adds very little propagational delay to the system. Propagational delay of the bus switch when used in a system is determined by the driving circuit on the driving side of the switch and its interaction with the load on the driven side.
3. See test circuit and waveforms.

## Applications Information

### Logic Inputs

Logic control inputs can be driven up to +5.5V regardless of the supply voltage. For example, given a 5.0V supply, the control or select pins may be driven low to 0V and high to 5.5V. Driving the control or select pins Rail-toRail® minimizes power consumption.

### Power-Supply Sequencing and Hot Plug Information

Proper power-supply sequencing is recommended for all CMOS devices. Always apply V<sub>CC</sub> and GND before applying signals to the input/output or control pins.
