\* The dead-time has to be set externally by the CPU; it is not part of the ASIPM internal functions.

\*\*Refer to the graph on next page.

\*\*\*Fault output signalling is given only when the internal OC, SC, and UV protection circuits are activated. The OC, SC and UV protection (and fault output) operate for the lower arms only. The OC and SC protection fault output is given in a pulse format while that of UV protection is maintained throughout the duration of the under-voltage condition.

$$****T = \frac{1}{\frac{1}{\beta} \cdot \ln \left[ \frac{R_T}{R_{TO}} \right] + \frac{1}{T_O}}$$
