1 PRODUCT OVERVIEW

OVERVIEW

The S3C7544 single-chip CMOS microcontroller is designed for high-performance using Samsung's newest 4-bit CPU core, SAM47 (Samsung Arrangeable Microcontrollers).

With a versatile 8-bit timer/counter and a D/A converter, the S3C7544 offers an excellent design solution for a wide variety of telecommunication applications.

Up to 17 pins of the 24-pin SDIP package can be dedicated to I/O. Four vectored interrupts provide fast response to internal and external events. In addition, the S3C7544's advanced CMOS technology has realized substantially lower power consumption with a wide operating voltage range — all at a substantially lower cost.

OTP

The S3C7544 microcontroller is also available in OTP (One Time Programmable) version, S3P7544. S3P7544 microcontroller has an on-chip 4-Kbyte one-time-programmable EPROM instead of masked ROM. The S3P7544 is comparable to S3C7544, both in function and in pin configuration.

OVERVIEW

The S3P7544 single-chip CMOS microcontroller is the OTP (One Time Programmable) version of the S3C7544 microcontroller. It has an on-chip OTP ROM instead of masked ROM. The EPROM is accessed by serial data format.

The S3P7544 is fully compatible with the S3C7544, both in function and in pin configuration. Because of its simple programming requirements, the S3P7544 is ideal for use as an evaluation chip for the S3C7544.

Parameter	Symbol	Conditions	Min	Typ	Max	Unit
Data retention supply voltage	V_{DDDR}	–	1.8	–	5.5	V

NOTES:
1. During oscillator stabilization wait time, all CPU operations must be stopped to avoid instability during oscillator start-up.
2. Use the basic timer mode register (BMOD) interval timer to delay the execution of CPU instructions during the wait time.
