## PIN DESCRIPTION

Pin No	Symbol	Description
1	OSCO	This output generates the reference frequency when it is connected to Pin 16 with the external OSC, whose frequency is 10.24MHz.
2	MODE	Base/Remote Unit Selection Pin. “High”: Base Unit “Low” : Remote Unit
3	SB	Standby pin. This input controls Tx PLL for reducing the power dissipation “High”: Normal operation “Low”: Standby
4	F1	5KHz output
5, 6 7, 8	D0, D1 D2, D3	Channel selection pins The Combinations of these inputs select one channel among the 10 channels
9	TIF	Input to programmable divider of Tx. AC coupling with VCO In case of a larger signal, It needs DC–coupling. Minimum input voltage is 0.1 Vrms
10	LDT	Unlocked signal out pin (see output characteristics)
11	PDT	Phase detector output for Tx. PDT detects the phase error from Tx PLL and its output is connected to the external low pass filter
12	VSS	This pin is the negative supply of the IC. It is usually grounded
13	PDR	Phase detector output for Rx. PDR detects the phase error from Rx PLL and its output is connected to the external low pass filter
14	RIF	Input of programmable divider for Rx. AC coupling with VCO In case of a larger signal (standard CMOS logic), it needs DC coupling. Minimum input voltage is 0.1Vrms
15	V <sub>DD</sub>	This pin is the positive supply of the IC Its reference is V <sub>SS</sub> , and normally + 3.0V ~ + 5.5V more positive than V <sub>SS</sub>
16	OSCI	X-TAL OSC connection pin This input generates the reference frequency when it is connected to pin 1 with the external OSC
