## APPLICATION INFORMATION

## 1. VOLTAGE GAIN ADJUSTMENT

The voltage gain :  $G_v$  is determined by  $R_1$ ,  $R_2$  and  $R_f$ .

$$G_v = 20 \log \frac{R_f + R_1 + R_2}{R_f + R_1}$$

When  $R_f = 0$

$$G_v = 57 \text{dB (Typ.)}$$

When  $R_f = 150 \Omega$

$$G_v = 45 \text{dB (Typ.) is given.}$$

The recommended voltage gain is more than 40dB.

Fig. 1

## 2. AUDIO MUTING

Audio muting can be accomplished by connecting 3 pin (ripple filter) to GND as shown in Fig.2.

Then, the bias circuit are cut off.

Amount of muting attenuation is about 60dB.

The ripple filter :  $C_3$  is in dead states at muting on. Therefore, the ripple rejection ratio should be checked at muting on/off in applications.

**3. INPUT AMPLIFIER**

The first stage is a PNP transistor, the input terminal voltage ( $Q_1$  base) is 60mV and less, and the volume :  $V_R$  can be directly coupled without a coupling capacitor.

But volume slide noise should be checked at volume up/down in applications.

Fig. 3

**4. THERMAL SHUT DOWN CIRCUIT**

This IC built in thermal shut down protector.

The operating temperature of thermal shut down circuit is 160°C (Typ.)

**5. CAPACITOR  $C_6$ ,  $C_7$** 

The purpose of capacitor  $C_6$ ,  $C_7$  are to prevent oscillation.

These capacitors need to be small temperature coefficient.

So celamic capacitor is unsuitable.

The voltage gain less than 40dB results occasionally in a parastic oscillation.

The following capacitor layout is recommended to refer the standard print board.

**6. INPUT VOLTAGE**

The maximum input voltage is 300mV<sub>rms</sub>(typ.). (at  $V_{CC}=12V$ ,  $R_L=4\Omega$ ,  $f=1kHz$ )

When input voltage is more 300mV<sub>rms</sub>, the output wave is turn up.
