

## SMPS - IC with SIPMOS Driver Output

TDA 4918

TDA 4919

Bipolar IC

### Features

- Switching frequency up to 300 kHz (TDA 4919) or 150 kHz (TDA 4918)
- Push-pull output driver with + 700 mA/– 500mA
- Separate GND for the driver outputs
- Feed-forward control
- Soft start
- Hysteresis adjustable at overvoltage and undervoltage comparator
- Current-saving starting circuit
- Current mode and voltage mode operation are possible

Type	Ordering Code	Package
☒ TDA 4918 A	Q67000-A8021	P-DIP-20-1
☒ TDA 4918 G	Q67000-A8142	P-DSO-20-1 (SMD)
☒ TDA 4919 A	Q67000-A8143	P-DIP-20-1
☒ TDA 4919 G	Q67000-A8018	P-DSO-20-1 (SMD)

### Functional Description

The versatile switch-mode power supply ICs for the direct control of SIPMOS power transistors comprise digital and analog functions. These functions are required for the design of high-quality flyback and forward converters during single-phase and push-pull operation in normal, half-bridge and full-bridge configurations. The ICs can also be used for transformerless voltage multipliers and speed-controlled motors. Malfunctions in the electrical operation of the switch-mode power supply are recognized by on-chip comparators which activate protective functions. The TDA 4918 has two driver outputs for push-pull switch-mode power supplies, as well as single-phase SMPS with a duty cycle limitation of 50 %. The TDA 4919 with a driver output is suitable for single-ended SMPS with duty cycles of up to 100% approximately.

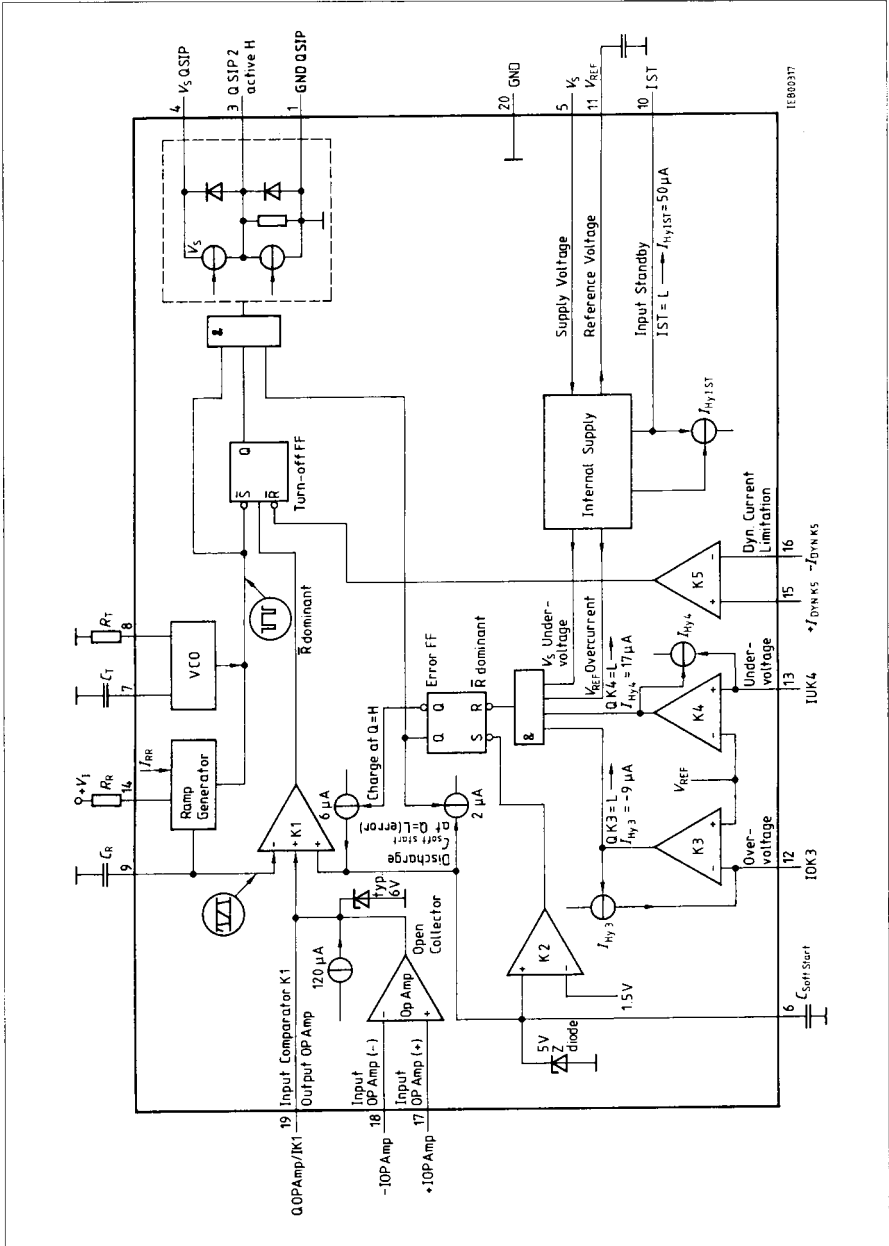

**Pin Configuration**  
(top view)

## Pin Definitions and Functions

Pin	Symbol	Function
1	GND Q SIP	Ground driver
2	Q SIP1	SIPMOS driver 1 (only TDA 4918)
3	Q SIP2	SIPMOS driver 2
4	$V_s$ QSIP	Supply voltage driver
5	$V_s$	Supply voltage
6	$C_{\text{soft start}}$	Soft start
7	$C_T$	Frequency generator
8	$R_T$	Frequency generator
9	$C_R$	Ramp generator
10	I ST	Input standby
11	$V_{\text{REF}}$	Reference voltage
12	I OK3	Input overvoltage
13	I UK4	Input undervoltage
14	$R_R$	Ramp generator
15	+ $I_{\text{DYN K5}}$	Dyn. current limitation
16	- $I_{\text{DYN K5}}$	Dyn. current limitation
17	I Op Amp (+)	Input operational amplifier
18	I Op Amp (-)	Input operational amplifier
19	Q Op Amp / IK1	Output operational amplifier Q Op Amp / input comparator
20	GND	Ground

Block Diagram (TDA 4918)

Block Diagram (TDA 4919)

## Functional Description

The various functional units of the component and their interaction are described in the following.

### Supply Voltage $V_s$

The IC enables the two outputs not before the turn-on threshold ( $V_{s\text{ON}}$ ) at  $V_s$  is exceeded. The duty cycle (active time/disable time) at the enabled outputs can then rise from zero to the value set with K1 in the time specified by the soft start.

An undervoltage at the standby input causes the current consumption  $I_s$  to remain at the very low standby current level independent of the voltage  $V_s$ .

### Voltage Controlled Oscillator (VCO)

The VCO is connected with the capacitor  $C_T$  and the resistor  $R_T$ . The charge current at  $C_T$  flows continuously and is set with resistor  $R_T$ . The discharge current is active during the discharge of  $C_T$  and is set internally.

In the typical mode of operation the duration of the rising edge is considerably greater than that of the falling edge. During the falling edge the VCO passes a trigger signal to the ramp generator thus discharging the ramp generator capacitance. Additionally, the trigger signal is routed to other parts of the IC.

### Ramp Generator

The ramp generator is triggered by the VCO and TDA 4919 operates at the same frequency as the VCO. The duration of the ramp generator falling edge must be shorter than the VCO fall time. Only then do the ramp generator upper and lower switching levels reach their rated values.

To control the pulse width at the output, the voltage of the ramp generator rising edge is compared with an externally adjustable dc voltage at comparator K1. The slope of the rising edge is adjusted via the current by means of  $R_R$ . This provides the possibility of an additional superimposed control of the output duty cycle. This control capability (feed-forward control) permits the compensation of known interference (e.g. input voltage ripple). A superimposed load current control (**current mode control**) however, can also be implemented.

### Push-Pull Flipflop (only TDA 4918)

The push-pull flipflop is switched by the falling edge of the VCO. This ensures that only one output of the two SIPMOS driver outputs is enabled at a time.

### Comparator K1 (Duty Cycle Control)

The two plus inputs of the comparator are switched such that the lower plus level is always compared with the level of the minus input. As soon as the voltage of the rising sawtooth edge (minus input) exceeds the lower level of the two plus inputs, the currently active output is disabled via the turn-off flipflop. The "high"-duration of the respectively active output can thus be infinitely varied. As the frequency remains constant, this process corresponds to a change in duty cycle.

### Operational Amplifier (Op Amp)

The op amp is a high quality operational amplifier. It can be used in the control circuit to transmit the amplified variations of the voltage to be regulated to the free plus input of comparator K1. A voltage change is thus converted to a duty cycle change.

### Turn-OFF Flipflop

The falling edge of the VCO causes a pulse at the turn-off flipflop set input. It can, however, only be actually set if no reset signal is pending. With the turn-OFF flipflop set, the outputs are enabled. Upon an error signal from K5 or upon a turn-off signal from K1 the flipflop disables the outputs.

### Z-Diode

The Z-diode limits the voltage at capacitor  $C_{\text{soft start}}$  to a maximum of 5 V. The ramp generator voltage can reach 5.5 V. For an appropriate slope of the rising ramp generator edge, the duty cycle can be limited to a desired maximum value. This can be a possible advantage in flyback converter operation.

### Comparator K2

The comparator has its switching threshold at 1.5 V at the plus input, and with its output it sets the error flipflop if the voltage at capacitor  $C_{\text{soft start}}$  is below 1.5 V. The error flipflop, however, will only accept the set pulse if no reset pulse (error) is pending. This prevents a restart of the outputs as long as an error signal is pending.

### Soft Start

The lower of the two voltages at the K1 plus inputs - compared with the ramp generator voltage - is a measure for the duty cycle at the output. At component turn-on, the voltage at capacitor  $C_{\text{soft start}}$  is equal to 0. As long as no error exists, the capacitor will be charged to the maximum value of 5V with a current of 6 $\mu$ A.

In the case of an error,  $C_{\text{soft start}}$  is discharged with a current of 2 $\mu$ A. The currently active output, however, is immediately disabled by the error flipflop. Below a charge voltage of 1.5 V, a set signal is pending at the error flipflop and the outputs are enabled if no reset signal is pending at the same time. As the minimum ramp generator voltage, however, is 1.8 V, the duty cycle at the outputs is actually only increased slowly and continuously after the voltage at  $C_{\text{soft start}}$  exceeds 1.8 V.

**Error Flipflop**

Error signals, routed to the error flipflop reset input, cause an immediate disabling of the outputs (low), and after elimination of the error, a restart of the outputs by soft start.

**Comparators K3 (Overvoltage), K4 (Undervoltage),  $V_{REF}$  Overcurrent,  $V_s$  Undervoltage**

These are error detectors that on error cause the error flipflop to immediately disable the outputs. After elimination of the error, the duty cycle is raised again using the soft start. Upon overvoltage, a current is impressed at the inputs of K3 and K4, that can be used to enable an adjustable hysteresis or a holding function. The value of the hysteresis is derived from the internal resistance of the external control source and the current impressed internally at the input of K3 or K4. In the undervoltage case, the set current flows at K4 into the component in the technical direction of current flow, with overvoltage at K3 out of the component.

**Comparator K5 (Dynamic Current Limiter)**

K5 serves to recognize overcurrents at the switching transistors. Both inputs of the comparator are externally accessible. After elimination of the error, the outputs are enabled with the VCO trigger pulse at the turn-off flipflop. The delay time between occurrence of an error and disabling of the outputs is only 250 ns.

**Standby Input (I ST)**

This input switches voltage and current hysteresis. The voltage levels for switching from standby to active operation can be set with an external voltage divider between  $V_s$  - standby input - ground.

In standby mode the component has a much lower current consumption compared to active operation. The outputs are then active low.

Should the component be operated by means of feedback supply from the switch-mode power supply, the starting phase can optimally be dimensioned.

**Reference Voltage ( $V_{REF}$ )**

The reference voltage source is a highly constant source with regard to its temperature behavior. It can be used for the external wiring of the op amp, the error comparators, the ramp generator, or other external components. The voltage source is short-circuit proof to ground.

**SIPMOS Driver Outputs (Q SIP)****TDA 4918**

The two outputs operate in the push-pull mode. They are active high. The duration during which one of the outputs is active, can be varied infinitely. The duration of the falling edge at the frequency generator is equal to the minimum duration during which both outputs are simultaneously low.

**TDA 4919**

The output is active high. The duration during which the output is active can be varied infinitely. The duration of the falling edge at the frequency generator is equal to the minimum duration during which the output is low (dead time).

The output drivers are designed as a push-pull stage. The output current is internally limited to the specified values.

A 10 k $\Omega$  resistor is connected between the output and ground. This resistor holds the SIPMOS transistor reliably disabled during standby operation (undervoltage at pin I St).

Output Q SIP is connected with the supply voltage  $V_{S\ Q\ SIP}$  and with ground via diodes.

The diode connected to  $V_S$  routes the capacitive shift currents from the SIPMOS transistor gate to the filter capacitor at  $V_S$  during turning on the SMPS supply voltage. The voltage at  $V_S$  can reach approximately 2.3 V without the SIPMOS transistor being turned on.

The diode connected to ground connects negative voltages at Q SIP to  $-0.7\text{ V}$ . This provides an unimpeded flow off of capacitive currents occurring during voltage breakdown at the SIPMOS transistor drain connection.

For supply voltages starting at approx. 2 V, both outputs are active low in the disabled state. The function of the diode connected to  $V_S$  is then taken over by the pull-down source.

The maximum output voltage is limited by the respectively lowest value of  $V_S$ ,  $V_{S\ Q\ SIP}$  or an internal Z-diode. The internal Z-diode limits the voltage at Q SIP to typ. 20 V.

## Absolute Maximum Ratings

$T_A = -40$  to  $85^\circ\text{C}$

Parameter	Symbol	Limit Values		Unit
		min.	max.	
Supply voltage	$V_{SQSIP}, V_S$	- 0.3	33	V
Inputs Op Amp, K3, K5, I ST	$V_I$	- 0.3	33	V
Input K4	$V_I$	- 0.3	$V_S$	V

## Frequency Generator (VCO)

Voltage at $R_T, C_T$	$V_{CT}, V_{RT}$	- 0.3	6	V
Current at $C_T$ $V_{CT} > 6\text{ V}$	$I_{CT}$		3	mA

## Ramp Generator

$C_R$ input	$V_{CR}$	- 0.3	6	V
$R_R$ input	$I_{RR}$	0	3	mA
Reference voltage	$V_{REF}$	- 0.3	6	V
Output Op Amp	$V_{Q\text{ op amp}}$	- 0.3	6	V
$V_{Q\text{ op amp}} > 6\text{ V}$	$I_{Q\text{ op amp}}$		2	mA
Driver output Q SIP <sup>1)</sup>	$V_{QSIP}$	- 0.3	$V_{SQSIP}$	V
Q SIP clamp diodes $V_{QSIP} > V_S$ or $V_{QSIP} < -0.3\text{ V}$	$I_{QSIP}$	- 100	100	mA
Soft start	$V_{C\text{ soft start}}$	- 0.3	6	V
$V_{C\text{ soft start}} > 6\text{ V}$	$I_{C\text{ soft start}}$	0	100	$\mu\text{A}$

Junction temperature	$T_j$		150	$^\circ\text{C}$
Storage temperature	$T_{slg}$	- 65	125	$^\circ\text{C}$
Thermal resistance system - air P-DIP-20	$R_{th\ SA}$		60	K/W
P-DSO-20	$R_{th\ SA}$		90	K/W

The characteristics refer to both the pins connected to ground.

<sup>1)</sup> With this, the max. power dissipation or junction temperature must be taken into account!

## Operating Range

Parameter	Symbol	Limit Values		Unit
		min.	max.	
Supply voltage	$V_S$	$V_{SON}^{1)}$	30	V
	$V_{SQ\ SIP}$		30	V
Frequency generator (VCO)	$f_{VCO}$		300	kHz
Ramp generator	$f_R$		300	kHz
Ambient temperature	$T_A$	- 40	85	°C
Ground QSIP	$V_{GNDQ\ SIP}$	- 0.3	0.5	V

## Characteristics

$V_{SON} < V_S < 30V^{2)}$ ,  $T_A = - 40$  to  $85^\circ C$

Parameter	Symbol	Limit Values			Unit	Test Condition
		min.	typ.	max.		
Current consumption without load at $V_{REF}$ Q op amp, Q SIP 1/2	$I_S$	6		18	mA	$C_T = 1\ nF$ frequency generator with 100 kHz outputs active
Standby operation	$I_{ST}$			3.5	mA	$V_S = 20\ V$

## Hysteresis at $V_S$

Turn-on threshold for $V_S$ rising	$V_{SH}$			9.6	V	$V_{IST} \geq V_{ISTH}$
Turn-off threshold for $V_S$ falling	$V_{SL}$	7.8			V	

The characteristics refer to both the pins connected to ground.

1) For  $V_{SON}$  values refer to characteristic data.

2)  $V_{SON}$  means that  $V_{S\ HIGH}$  has been exceeded, while  $V_{S\ LOW}$  has not yet been undercut.

## Characteristics (cont'd)

$V_{SON} < V_S < 30\text{ V}^1$ ,  $T_A = -40$  to  $85\text{ }^\circ\text{C}$

Parameter	Symbol	Limit Values			Unit	Test Condition
		min.	typ.	max.		

## Reference

Voltage	$V_{REF}$	2.475	2.5	2.525	V	$I_{REF} = 1\text{ mA}$ $T_A = 25\text{ }^\circ\text{C}$ $V_S = 15\text{ V}$
Load current	$-I_{REF}$	0		3	mA	
Voltage change	$\Delta V_{REF}$			10	mV	$I_{REF} = 1\text{ mA} \pm 20\%$
Voltage change	$\Delta V_{REF}$			3	mV	$V_S = 15\text{ V} \pm 20\%$
Temperature response	$\frac{\Delta V_{REF}}{\Delta T \Delta}$	-0.3		0.3	mV/K	
Response threshold for $V_{REF}$ overcurrent	$-I_{REF O}$	4	7	10	mA	

## Frequency Generator (VCO)

Frequency range	$f_{VCO}$			300	kHz	
Frequency change	$\Delta f/f_{VCO}$			1	%	$V_S = 15\text{ V} \pm 20\%$
Tolerance	$\Delta f/f_{VCO}$	-7		7	%	$C_T = 1\text{ nF}$ $f_{VCO} = 100\text{ kHz}$ ; $T_A = 25\text{ }^\circ\text{C}$
Charge current for $C_T$ (perm.) = current at pin $R_T$	$-I_{RT}$	0		1	mA	$I_{RT} = V_{REF}/R_T$
Discharge current for $C_T$	$I_{dch}$		2		mA	internally fixed
$C_T$ range		0.47		68	nF <sup>2)</sup>	
Dead time	$T_i$		350	450	ns	$C_T = 470\text{ pF}$ , $f_{VCO} = 100\text{ kHz}$
			400	500	ns <sup>2)</sup>	$C_T = 470\text{ pF}$ , $f_{VCO} = 300\text{ kHz}$

1)  $V_{SON}$  means that  $V_{S\text{ HIGH}}$  has been exceeded, while  $V_{S\text{ LOW}}$  has not yet been undercut.

2) The time of the falling edge (fall time) is proportional to  $C_T$ , if the discharge current largely exceeds the charge current. The fall time is proportional to the minimum dead time at the outputs.

## Characteristics (cont'd)

$V_{SON} < V_S < 30 \text{ V}^1$ ,  $T_A = -40$  to  $85 \text{ }^\circ\text{C}$

Parameter	Symbol	Limit Values			Unit	Test Condition
		min.	typ.	max.		

### Ramp Generator

Frequency range	$f_R$			300	kHz	
Maximum voltage at $C_R$	$V_{CRH}$	5.4	6.1	6.7	V	
Minimum voltage at $C_R$	$V_{CRL}$	1.65	1.8	1.95	V	
Charge current for $C_R$ (perm) = current at pin $R_R$	$I_{ch}$	0		1	mA	$V_{RR}$ approx. 0.7 V internally fixed
Discharge current for $C_R$	$I_{dch}$	1.3	2	2.7	mA	
Ratio $I_{RR}/I_{CR \text{ charge}}$		0.95		1.1		$I_{RR} = 0.5 \text{ mA}$

Duty cycle (active time/ period at output)	$t_V$		5/20			
Temperature coefficient of duty cycle	$T_C$		0.2		%/K	

### Comparator K1

Input current	$-I_{K1}$			2	$\mu\text{A}$	
Common-mode input voltage range	$V_{IC}$	0		$V_{CRH}$	V	
Turn-OFF delay time	$t$			500	ns <sup>2)</sup>	Rated load 3 nF at Q SIP

1)  $V_{SON}$  means that  $V_{SHGH}$  has been exceeded, while  $V_{SLOW}$  has not yet been undercut.

2) Step function  $V_{REF} = -100 \text{ mV} \rightarrow V_{REF} = +100 \text{ mV}$  (for transit time from input comparator to Q SIP)

## Characteristics (cont'd)

$V_{SON} < V_S < 30\text{ V}^1)$ ,  $T_A = -40$  to  $85\text{ }^\circ\text{C}$

Parameter	Symbol	Limit Values			Unit	Test Condition
		min.	typ.	max.		

### Operational Amplifier

Open-loop voltage gain	$G_{VO}$	60	80		dB	
Input offset voltage	$V_{IO}$	-10		10	mV	Pin 19 n.c.
Input current	$-I_{I\text{ op amp}}$			2	$\mu\text{A}$	
Common-mode input voltage range	$V_{IC}$	0		4	V	
Output current	$I_{O\text{ op amp}}$	0		2	mA	
Output voltage range	$V_O$	0.5		$V_{CRH}$	V	$0\text{ mA} < I_O < 2\text{ mA}$
Transition frequency	$f_T$		3		mHz	
Transition phase	$\phi_T$		120		deg.	
Temperature coefficient of $V_{IO}$	$TC$	-30		30	$\mu\text{V/K}$	Pin 19 n.c.; $V_{IC} = 3\text{ V}$
Source current at Q Op Amp	$I_{\text{op amp}}$	70	100	130	$\mu\text{A}$	$0.5\text{ V} < V_O < V_{CRH}$

### Soft Start

Charge current for $C_{\text{soft start}}$	$I_{ch}$	4	6	8	$\mu\text{A}$	
Discharge current for $C_{\text{soft start}}$	$I_{dch}$	1	2	3.2	$\mu\text{A}$	
Upper limiting voltage	$V_{lim}$	4.4	4.8	5.0	V	
Switching voltage of K2	$V_{K2}$	1.3	1.5	1.7	V	

1)  $V_{SON}$  means that  $V_{SHGH}$  has been exceeded, while  $V_{SLOW}$  has not yet been undercut.

## Characteristics (cont'd)

$V_{SON} < V_S < 30 \text{ V}^1$ ,  $T_A = -40$  to  $85^\circ\text{C}$

Parameter	Symbol	Limit Values			Unit	Test Condition
		min.	typ.	max.		

### Dynamic Current Limitation K5

Input current	$-I_{IDYN}$	-10		2	$\mu\text{A}$	
Input offset voltage	$V_{IO}$			10	mV	
Common-mode input voltage range	$V_{IC}$	0		$V_S - 3$	V	
Turn-OFF delay time	$t$		250	400	$\text{ns}^2$ )	Rated load 3 nF at QSIP

### Undervoltage K4

Input current at K4	$-I_{IK4}$			0.2	$\mu\text{A}$	
Switching voltage at K4	$V_{SW}$	$V_{REF} - 0.01$		$V_{REF} + 0.01$	V	
Hysteresis current	$I_{Hy4H}$ $I_{Hy4L}$	11	17	22 0.1	$\mu\text{A}$ $\mu\text{A}$	$V_{(+K4)} < V_{SW}$ $V_{(+K4)} > V_{SW}$
Turn-OFF delay time	$t$			3	$\mu\text{s}^2$ )	

### Overvoltage K3

Input current	$-I_{IK3}$			0.2	$\mu\text{A}$	
Switching voltage	$V_{SW}$	$V_{REF} - 0.01$		$V_{REF} + 0.01$	V	
Turn-OFF delay time	$t$			3	$\mu\text{s}^2$ )	
Hysteresis current	$-I_{Hy3H}$ $-I_{Hy3L}$	6	9	12 0.1	$\mu\text{A}$ $\mu\text{A}$	$V_{(-K6)} > V_{SW}$ $V_{(-K6)} < V_{SW}$

1)  $V_{SON}$  means that  $V_{SHIGH}$  has been exceeded, while  $V_{SLOW}$  has not yet been undercut.

2) Step function  $V_{REF} = -100 \text{ mV} \rightarrow V_{REF} = +100 \text{ mV}$  (for transit time from input comparator to Q SIP)

## Characteristics (cont'd)

$V_{SON} < V_S < 40 \text{ V}^1)$ ,  $T_A = -40$  to  $85 \text{ }^\circ\text{C}$

Parameter	Symbol	Limit Values			Unit	Test Condition
		min.	typ.	max.		

### Output Driver QSIP 1/2

H-output voltage	$V_{OH}$	$V_S - 3$			V	$I_{QSIP} = -250 \text{ mA};$ $V_S = V_{SQSIP}$
L-output voltage	$V_{OL}$			2.1	V	$I_{QSIP} = +250 \text{ mA};$ $V_S = V_{SQSIP}$
	$V_{QL}$			1.4	V	$I_{QSIP} = +10 \text{ mA};$ $V_S = V_{SQSIP}$
Output current	$I_{QSIP}$	500	700		$\text{mA}^2)$	$\left\{ \begin{array}{l} C_{QSIP} = 10 \text{ nF}; \\ V_S = V_{SQSIP} = 20 \text{ V} \\ C_{QSIP} = 10 \text{ nF}; \\ V_S = V_{SQSIP} = 15 \text{ V} \\ C_{QSIP} = 10 \text{ nF}; \\ V_S = V_{SQSIP} = 10 \text{ V} \end{array} \right.$
	$-I_{QSIP}$					
	$I_{QSIP}$		600			
	$-I_{QSIP}$		500			
	$I_{QSIP}$		400			
	$-I_{QSIP}$		400			

### Input Standby IST

Turn-ON threshold for $V_{IST}$ rising	$V_{ISTH}$	6.1	6.8	7.5	V	$V_S > V_{SON};$ $T_A = 25 \text{ }^\circ\text{C}$
Temperature response	$\Delta V_{ISTH}/\Delta T$		-0.023		%/K	
Turn-OFF threshold for $V_{IST}$ falling	$V_{ISTL}$	5.5	6.1	6.7	V	
Temperature response	$\Delta V_{ISTL}/\Delta T$		0.047		%/K	
Hysteresis current	$-I_{HyISTH}$	35	50	65	$\mu\text{A}$	$V_{IST} > V_{ISTH}$ $V_{ISTL} \leq V_{IST} \leq V_{ISTH};$ $T_A = 25 \text{ }^\circ\text{C}$
	$I_{HyISTL}$				$\mu\text{A}$	
Temperature response	$\Delta I_{HyIST}/\Delta T$		0.01		%/K	

1)  $V_{SON}$  means that  $V_{SHGH}$  has been exceeded, while  $V_{SLOW}$  has not yet been undercut.

2) Dynamic maximum current during rising or falling edge.
