

# TDA7442 TDA7442D

## -tone control and surround digitally controlled audio processor

### 1 FEATURES

- 4 STEREO INPUTS
- INPUT ATTENUATION CONTROL IN 0.5dB STEP
- TREBLE AND BASS CONTROL
- TWO SURROUND MODE AVAILABLE WITH 4 SELECTABLE RESPONSES:
  - MUSIC
  - SIMULATED STEREO
- TWO SPEAKER ATTENUATORS:
  - 2 INDEPENDENT SPEAKER CONTROLS IN 1dB STEPS FOR BALANCE FACILITY
  - INDEPENDENT MUTE FUNCTION
- ALL FUNCTIONS PROGRAMMABLE VIA SERIAL BUS
- 2 MONITOR OUTPUT (ONLY FOR TDA7442)

### 2 DESCRIPTION

The TDA7442/42D is volume tone (bass and treble) balance (Left/Right) processors for quality audio applications in TV and Hi-Fi systems.

It reproduces surround sound by using a program-

Figure 1. Packages

Table 1. Order Codes

Part Number	Package
TDA7442	SDIP-32
TDA7442D	SO-28
TDA7442D013TR	Tape & Reel

mable phase shifter. Control of all the functions is accomplished by serial bus.

The AC signal setting is obtained by resistor networks and switches combined with operational amplifiers.

Thanks to the BIPOLAR/CMOS Technology used, Low Distortion, Low Noise and DC stepping are obtained.

### 3 I<sup>2</sup>C BUS INTERFACE

Data transmission from microprocessor to the TDA7442D and vice versa takes place through the 2 wires I<sup>2</sup>C BUS interface, consisting of the two lines SDA and SCL (pull-up resistors to positive supply voltage must be connected).

#### 3.1 Data Validity

As shown in fig. 5, the data on the SDA line must be stable during the high period of the clock. The HIGH and LOW state of the data line can only change when the clock signal on the SCL line is LOW.

#### 3.2 Start and Stop Conditions

As shown in fig. 6 a start condition is a HIGH to LOW transition of the SDA line while SCL is HIGH. The stop condition is a LOW to HIGH transition of the SDA line while SCL is HIGH.

#### 3.3 Byte Format

Every byte transferred on the SDA line must contain 8 bits. Each byte must be followed by an acknowledge bit. The MSB is transferred first.

#### 3.4 Acknowledge

The master ( $\mu$ P) puts a restive HIGH level on the SDA line during the acknowledge clock pulse (see fig. 3). The peripheral (audio processor) that acknowledges has to pull-down (LOW) the SDA line during this clock pulse.

The audio processor which has been addressed has to generate an acknowledge after the reception of each byte, otherwise the SDA line remains at the HIGH level during the ninth clock pulse time. In this case the master transmitter can generate the STOP information in order to abort the transfer.

#### 3.5 Transmission without Acknowledge

Avoiding to detect the acknowledge of the audio processor, the  $\mu$ P can use a simpler transmission: simply it waits one clock without checking the slave acknowledging, and sends the new data.

This approach of course is less protected from misworking.

Figure 5. Data Validity on the I<sup>2</sup>C BUS

Figure 6. Timing Diagram of I<sup>2</sup>C BUS

Figure 7. Acknowledge on the I<sup>2</sup>C BUS

## 4 SOFTWARE SPECIFICATION

### Interface Protocol

The interface protocol comprises:

- A start condition (S)
- A chip address byte, containing the TDA7442D
- A subaddress bytes
- A sequence of data (N byte + acknowledge)
- A stop condition (P)

ACK = Acknowledge

S = Start

P = Stop

A = Address

B = Auto Increment

### 4.1 EXAMPLES

#### 4.1.1 No Incremental Bus

The TDA7442D receives a start condition, the correct chip address, a subaddress with the MSB = 0 (no incremental bus), N-datas (all these data concern the subaddress selected), a stop condition.

#### 4.1.2 Incremental Bus

The TDA7442D receive a start conditions, the correct chip address, a subaddress with the MSB = 1 (incremental bus): now it is in a loop condition with an autoincrease of the subaddress whereas SUBADDRESS from "1XXX1010" to "1XXX1111" of DATA are ignored.

The DATA 1 concern the subaddress sent, and the DATA 2 concerns the subaddress sent plus one sent in the loop etc, and at the end it receives the stop condition.

## 5 DATA BYTES

Address = 80(HEX)

### 5.1 Function Selection:

The first byte (subaddress)
