TMS320C6203B FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS086M – JANUARY 1999 – REVISED MARCH 2004

description

The TMS320C6203B device is part of the TMS320C62x™ fixed-point DSP generation in the TMS320C6000™ DSP platform. The C62x™ DSP devices are based on the high-performance, advanced VelociTI™ very-long-instruction-word (VLIW) architecture developed by Texas Instruments (TI), making these DSPs an excellent choice for multichannel and multifunction applications.

The TMS320C62x™ DSP offers cost-effective solutions to high-performance DSP-programming challenges. The TMS320C6203B has a performance capability of up to 2400 MIPS at a clock rate of 300 MHz. The C6203B DSP possesses the operational flexibility of high-speed controllers and the numerical capability of array processors. This processor has 32 general-purpose registers of 32-bit word length and eight highly independent functional units. The eight functional units provide six arithmetic logic units (ALUs) for a high degree of parallelism and two 16-bit multipliers for a 32-bit result. The C6203B can produce two multiply-accumulates (MACs) per cycle for a total of 600 million MACs per second (MMACS). The C6203B DSP also has application-specific hardware logic, on-chip memory, and additional on-chip peripherals.

The C6203B device program memory consists of two blocks, with a 256K-byte block configured as memory-mapped program space, and the other 128K-byte block user-configurable as cache or memory-mapped program space. Data memory for the C6203B consists of two 256K-byte blocks of RAM.

The C6203B device has a powerful and diverse set of peripherals. The peripheral set includes three multichannel buffered serial ports (McBSPs), two general-purpose timers, a 32-bit expansion bus (XBus) that offers ease of interface to synchronous or asynchronous industry-standard host bus protocols, and a glueless 32-bit external memory interface (EMIF) capable of interfacing to SDRAM or SBRAM and asynchronous peripherals.

The C62x devices have a complete set of development tools which includes: a new C compiler, an assembly optimizer to simplify programming and scheduling, and a Windows™ debugger interface for visibility into source code execution.

device characteristics

Table 1 provides an overview of the TMS320C6203B, TMS320C6202, TMS320C6202B, and TMS320C6204 DSPs. The table shows significant features of each device, including the capacity of on-chip RAM, the peripherals, the execution time, and the package type with pin count, etc. This data sheet primarily focuses on the functionality of the TMS320C6203B device although it also identifies to the user the pin-compatibility of the C6203B and C6202 GLS, and the C6204 GLW BGA packages. This data sheet identifies the pin-compatibility of the C6203B and the C6202B GNZ and GNY packages. For the functionality information on the TMS320C6202/02B devices, see the *TMS320C6202, TMS320C6202B Fixed-Point Digital Signal Processors Data Sheet* (literature number SPRS104). For the functionality information on the TMS320C6204 device, see the *TMS320C6204 Fixed-Point Digital Signal Processor Data Sheet* (literature number SPRS152). And for more details on the C6000™ DSP part numbering, see Figure 4.

TMS320C6203B

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS086M – JANUARY 1999 – REVISED MARCH 2004

C62x device compatibility

The TMS320C6202, C6202B, C6203B, and C6204 devices are pin-compatible; thus, making new system designs easier and providing faster time to market. The following list summarizes the C62x DSP device characteristic differences:

- Core Supply Voltage (1.8 V versus 1.7 V versus 1.5 V)

The C6202 device core supply voltage is 1.8 V while the C6202B, C6203B, C6204 devices have core supply voltages of 1.5 V. The C6203B device (GLS, GNY, and GNZ packages) also has a 1.7-V core supply voltage.

- Device Clock Speeds

The C6202B and C6203B devices run at –250 and –300 MHz clock speeds (with a C620xBGNZA extended temperature device that also runs at –250 MHz), while the C6202 device runs at –200 and –250 MHz, and the C6204 device runs at –200 MHz clock speed.

- PLL Options Availability

Table 1 identifies the available PLL multiply factors [e.g., CLKIN x1 (PLL bypassed), x4, etc.] for each of the C62x DSP devices. For additional details on the PLL clock module and specific options for the C6203B device, see the *Clock PLL* section of this data sheet.

For additional details on the PLL clock module and specific options for the C6202/02B devices, see the *Clock PLL* section of the *TMS320C6202, TMS320C6202B Fixed-Point Digital Signal Processors Data Sheet* (literature number SPRS104).

And for additional details on the PLL clock module and specific options for the C6204 device, see the *Clock PLL* section of the *TMS320C6204 Fixed-Point Digital Signal Processor Data Sheet* (literature number SPRS152).

- On-Chip Memory Size

The C6202/02B, C6203B, and C6204 devices have different on-chip program memory and data memory sizes (see Table 1).

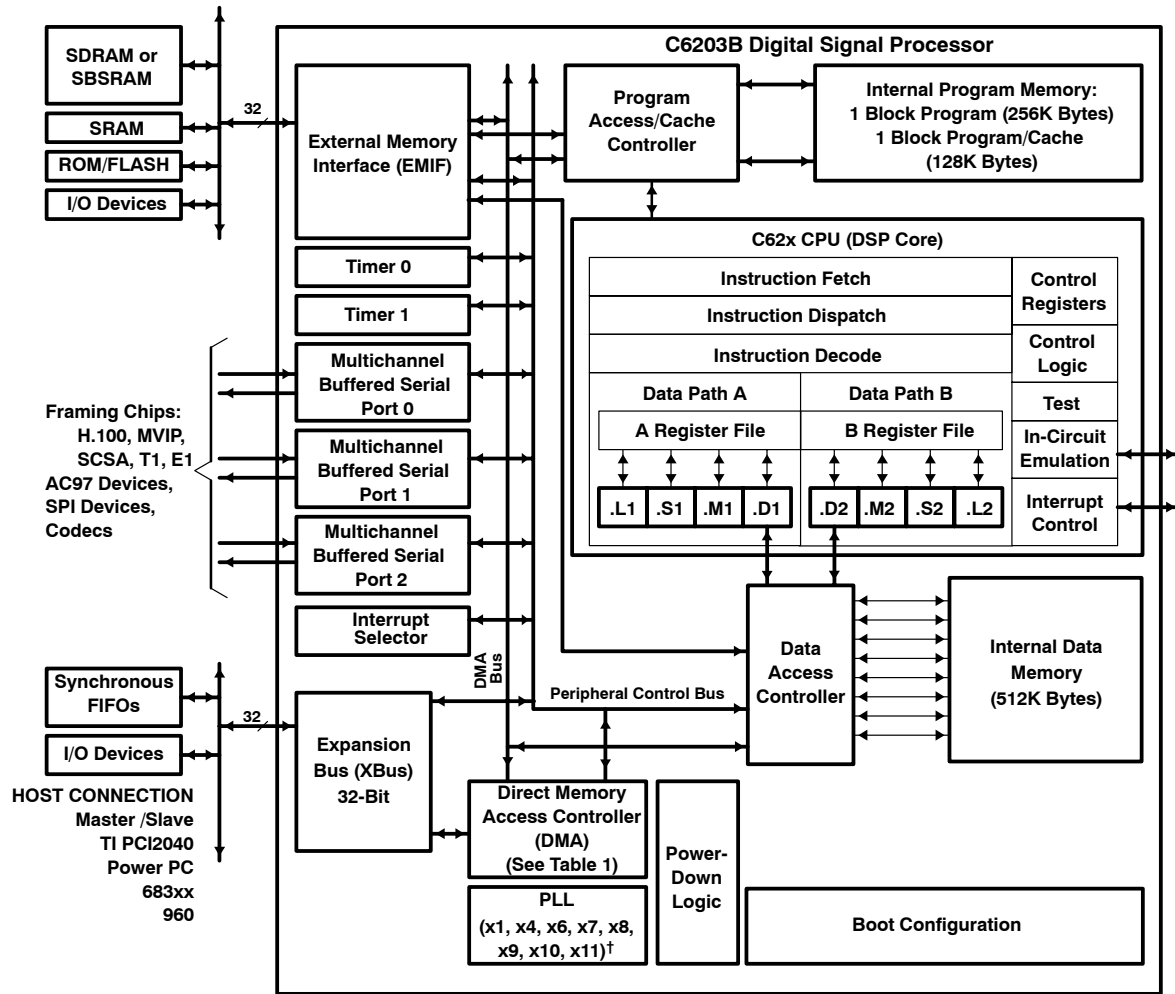

- McBSPs

The C6202, C6202B, and C6203B devices have three McBSPs while the C6204 device has two McBSPs on-chip.

For a more detailed discussion on migration concerns, and similarities/differences between the C6202, C6202B, C6203B, and C6204 devices, see the *How to Begin Development Today and Migrate Across the TMS320C6202/02B/03B/04 DSPs Application Report* (literature number SPRA603).

functional and CPU (DSP core) block diagram

[†] For additional details on the PLL clock module and specific options for the C6203B device, see Table 1 and the *Clock PLL* section of this data sheet.

TMS320C6203B

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS086M – JANUARY 1999 – REVISED MARCH 2004

CPU (DSP core) description

The CPU fetches VelociTI advanced very-long instruction words (VLIW) (256 bits wide) to supply up to eight 32-bit instructions to the eight functional units during every clock cycle. The VelociTI VLIW architecture features controls by which all eight units do not have to be supplied with instructions if they are not ready to execute. The first bit of every 32-bit instruction determines if the next instruction belongs to the same execute packet as the previous instruction, or whether it should be executed in the following clock as a part of the next execute packet. Fetch packets are always 256 bits wide; however, the execute packets can vary in size. The variable-length execute packets are a key memory-saving feature, distinguishing the C62x CPU from other VLIW architectures.

The CPU features two sets of functional units. Each set contains four units and a register file. One set contains functional units .L1, .S1, .M1, and .D1; the other set contains units .D2, .M2, .S2, and .L2. The two register files each contain 16 32-bit registers for a total of 32 general-purpose registers. The two sets of functional units, along with two register files, compose sides A and B of the CPU [see the functional and CPU (DSP core) block diagram and Figure 1]. The four functional units on each side of the CPU can freely share the 16 registers belonging to that side. Additionally, each side features a single data bus connected to all the registers on the other side, by which the two sets of functional units can access data from the register files on the opposite side. While register access by functional units on the same side of the CPU as the register file can service all the units in a single clock cycle, register access using the register file across the CPU supports one read and one write per cycle.

Another key feature of the C62x CPU is the load/store architecture, where all instructions operate on registers (as opposed to data in memory). Two sets of data-addressing units (.D1 and .D2) are responsible for all data transfers between the register files and the memory. The data address driven by the .D units allows data addresses generated from one register file to be used to load or store data to or from the other register file. The C62x CPU supports a variety of indirect addressing modes using either linear- or circular-addressing modes with 5- or 15-bit offsets. All instructions are conditional, and most can access any one of the 32 registers. Some registers, however, are singled out to support specific addressing or to hold the condition for conditional instructions (if the condition is not automatically “true”). The two .M functional units are dedicated for multiplies. The two .S and .L functional units perform a general set of arithmetic, logical, and branch functions with results available every clock cycle.

The processing flow begins when a 256-bit-wide instruction fetch packet is fetched from a program memory. The 32-bit instructions destined for the individual functional units are “linked” together by “1” bits in the least significant bit (LSB) position of the instructions. The instructions that are “chained” together for simultaneous execution (up to eight in total) compose an execute packet. A “0” in the LSB of an instruction breaks the chain, effectively placing the instructions that follow it in the next execute packet. If an execute packet crosses the 256-bit-wide fetch-packet boundary, the assembler places it in the next fetch packet, while the remainder of the current fetch packet is padded with NOP instructions. The number of execute packets within a fetch packet can vary from one to eight. Execute packets are dispatched to their respective functional units at the rate of one per clock cycle and the next 256-bit fetch packet is not fetched until all the execute packets from the current fetch packet have been dispatched. After decoding, the instructions simultaneously drive all active functional units for a maximum execution rate of eight instructions every clock cycle. While most results are stored in 32-bit registers, they can be subsequently moved to memory as bytes or half-words as well. All load and store instructions are byte-, half-word, or word-addressable.

TMS320C6203B FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS086M – JANUARY 1999 – REVISED MARCH 2004

memory map summary

Table 2 shows the memory map address ranges of the C6203B device. The C6203B device has the capability of a MAP 0 or MAP 1 memory block configuration. These memory block configurations are set up at reset by the boot configuration pins (generically called BOOTMODE[4:0]). For the C6203B device, the BOOTMODE configuration is handled, at reset, by the expansion bus module (specifically XD[4:0] pins). For more detailed information on the C6203B device settings, which include the device boot mode configuration at reset and other device-specific configurations, see *TMS320C620x/C670x DSP Boot Modes and Configuration (SPRU642)*.

0198 0008	CNT1	Timer 1 counter register	Contains the current value of the incrementing counter.
0198 000C–019B FFFF	—	Reserved	

DMA synchronization events

The C6203B DMA supports up to four independent programmable DMA channels. The four main DMA channels can be read/write synchronized based on the events shown in Table 13. Selection of these events is done via the RSYNC and WSYNC fields in the Primary Control registers of the specific DMA channel. For more detailed information on the DMA module, associated channels, and event-synchronization, see *TMS320C620x/C670x DSP Program and Data Memory Controller / Direct Memory Access (DMA) Controller Reference Guide* (literature number SPRU577).

Table 13. TMS320C6203B DMA Synchronization Events

DMA EVENT NUMBER (BINARY)	EVENT NAME	EVENT DESCRIPTION
00000	Reserved	Reserved
00001	TINT0	Timer 0 interrupt
00010	TINT1	Timer 1 interrupt
00011	SD_INT	EMIF SDRAM timer interrupt

10010	REVT2	McBSP2 receive event
10011 –11111	Reserved	Reserved. Not used.

TMS320C6203B FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS086M – JANUARY 1999 – REVISED MARCH 2004

interrupt sources and interrupt selector

The C62x DSP core supports 16 prioritized interrupts, which are listed in Table 14. The highest-priority interrupt is INT_00 (dedicated to RESET) while the lowest-priority interrupt is INT_15. The first four interrupts (INT_00–INT_03) are non-maskable and fixed. The remaining interrupts (INT_04–INT_15) are maskable and default to the interrupt source specified in Table 14. The interrupt source for interrupts 4–15 can be programmed by modifying the selector value (binary value) in the corresponding fields of the Interrupt Selector Control registers: MUXH (address 0x019C0000) and MUXL (address 0x019C0004).

Table 14. C6203B DSP Interrupts

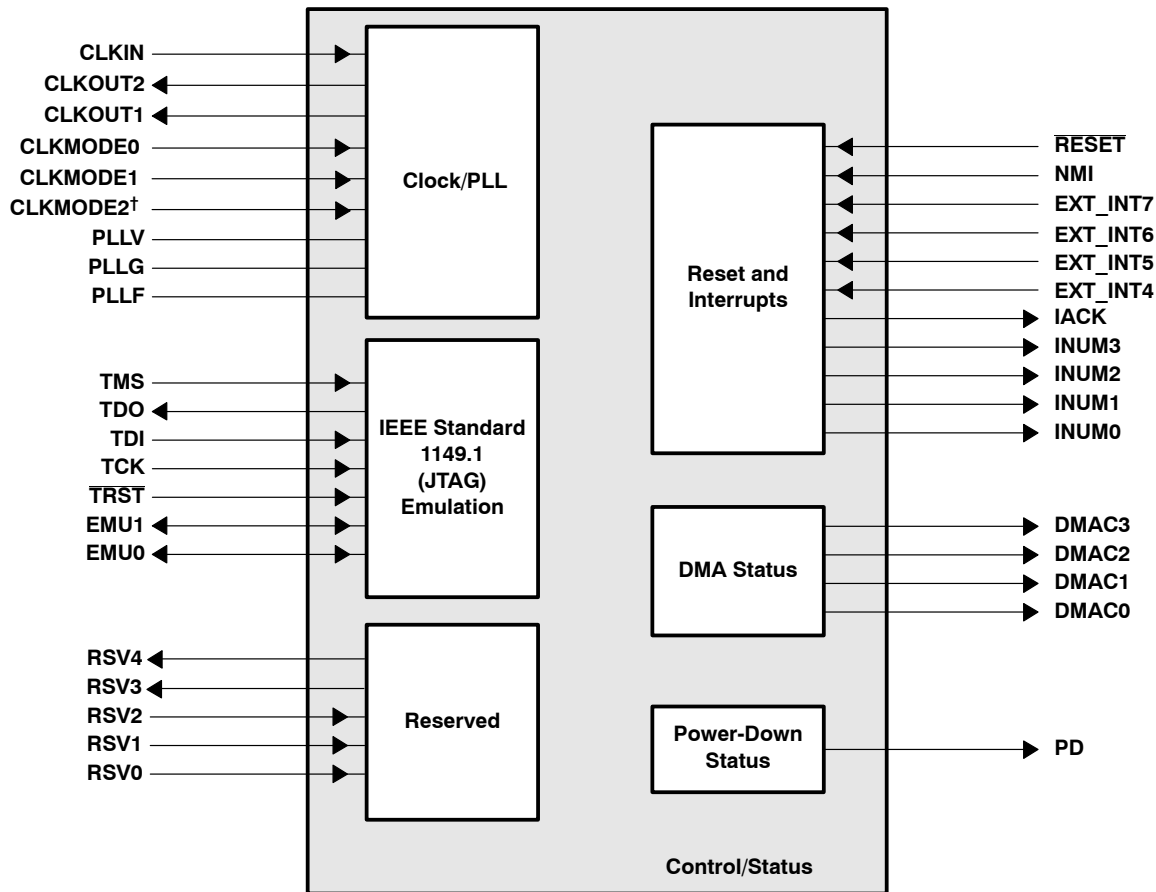

CPU INTERRUPT NUMBER	INTERRUPT SELECTOR CONTROL REGISTER	SELECTOR VALUE (BINARY)	INTERRUPT EVENT	INTERRUPT SOURCE
INT_00 [†]	—	—	RESET	
INT_01 [†]	—	—	NMI	
INT_02 [†]	—	—	Reserved	Reserved. Do not use.
INT_03 [†]	—	—	Reserved	Reserved. Do not use.
INT_04 [‡]	MUXL[4:0]	00100	EXT_INT4	External interrupt pin 4
INT_05 [‡]	MUXL[9:5]	00101	EXT_INT5	External interrupt pin 5
INT_06 [‡]	MUXL[14:10]	00110	EXT_INT6	External interrupt pin 6
INT_07 [‡]	MUXL[20:16]	00111	EXT_INT7	External interrupt pin 7
INT_08 [‡]	MUXL[25:21]	01000	DMA_INT0	DMA channel 0 interrupt
INT_09 [‡]	MUXL[30:26]	01001	DMA_INT1	DMA channel 1 interrupt
INT_10 [‡]	MUXH[4:0]	00011	SD_INT	EMIF SDRAM timer interrupt
INT_11 [‡]	MUXH[9:5]	01010	DMA_INT2	DMA channel 2 interrupt
INT_12 [‡]	MUXH[14:10]	01011	DMA_INT3	DMA channel 3 interrupt
INT_13 [‡]	MUXH[20:16]	00000	DSP_INT	Host-processor-to-DSP interrupt
INT_14 [‡]	MUXH[25:21]	00001	TINT0	Timer 0 interrupt
INT_15 [‡]	MUXH[30:26]	00010	TINT1	Timer 1 interrupt
—	—	01100	XINT0	McBSP0 transmit interrupt
—	—	01101	RINT0	McBSP0 receive interrupt
—	—	01110	XINT1	McBSP1 transmit interrupt
—	—	01111	RINT1	McBSP1 receive interrupt
—	—	10000	Reserved	Reserved. Not used.
—	—	10001	XINT2	McBSP2 transmit interrupt
—	—	10010	RINT2	McBSP2 receive interrupt
—	—	10011 – 11111	Reserved	Reserved. Do not use.

[†] Interrupts INT_00 through INT_03 are non-maskable and fixed.

[‡] Interrupts INT_04 through INT_15 are programmable by modifying the binary selector values in the Interrupt Selector Control registers fields. Table 14 shows the default interrupt sources for Interrupts INT_04 through INT_15. For more detailed information on interrupt sources and selection, see *TMS320C6000 DSP Interrupt Selector Reference Guide* (literature number SPRU646).

signal groups description

† CLKMODE2 is NOT available on the GNZ package for the C6203B device.

Signal Descriptions

SIGNAL NAME	PIN NO.		TYPE†	DESCRIPTION
	GNZ	GLS/ GNY		
CLOCK/PLL				
CLKIN	C12	B10	I	Clock input
CLKOUT1	AD20	Y18	O	Clock output at full device speed
CLKOUT2	AC19	AB19	O	Clock output at half (1/2) of device speed <input type="checkbox"/> Used for synchronous memory interface
CLKMODE0	B15	B12	I	Clock mode selects
CLKMODE1	C11	A9	I	<input type="checkbox"/> Selects what multiply factors of the input clock frequency the CPU frequency equals. For more details on the GNZ, GLS, and GNY CLKMODE pins and the PLL multiply factors for the C6203B device, see the <i>Clock PLL</i> section of this data sheet.
CLKMODE2	–	A14	I	
PLLV‡	D13	C11	A§	PLL analog V _{CC} connection for the low-pass filter
PLLG‡	D14	C12	A§	PLL analog GND connection for the low-pass filter
PLL‡	C13	A11	A§	PLL low-pass filter connection to external components and a bypass capacitor
JTAG EMULATION				
TMS	AD7	Y5	I	JTAG test-port mode select (features an internal pullup)
TDO	AE6	AA4	O/Z	JTAG test-port data out
TDI	AF5	Y4	I	JTAG test-port data in (features an internal pullup)
TCK	AE5	AB2	I	JTAG test-port clock
TRST	AC7	AA3	I	JTAG test-port reset (features an internal pulldown)
EMU1	AF6	AA5	I/O/Z	Emulation pin 1, pullup with a dedicated 20-kΩ resistor¶
EMU0	AC8	AB4	I/O/Z	Emulation pin 0, pullup with a dedicated 20-kΩ resistor¶
RESET AND INTERRUPTS				
RESET	K2	J3	I	Device reset
NMI	L2	K2	I	Nonmaskable interrupt <input type="checkbox"/> Edge-driven (rising edge)
EXT_INT7	V4	U2	I	External interrupts <input type="checkbox"/> Edge-driven <input type="checkbox"/> Polarity independently selected via the External Interrupt Polarity Register bits (EXTPOL.[3:0])
EXT_INT6	Y2	U3		
EXT_INT5	AA1	W1		
EXT_INT4	W4	V2		
IACK	Y1	V1	O	Interrupt acknowledge for all active interrupts serviced by the CPU
INUM3	V2	R3	O	Active interrupt identification number <input type="checkbox"/> Valid during IACK for all active interrupts (not just external) <input type="checkbox"/> Encoding order follows the interrupt-service fetch-packet ordering
INUM2	U4	T1		
INUM1	V3	T2		
INUM0	W2	T3		

† I = Input, O = Output, Z = High Impedance, S = Supply Voltage, GND = Ground

‡ PLLV, PLLG, and PLLF are not part of external voltage supply or ground. See the *clock PLL* section for information on how to connect these pins.

§ A = Analog Signal (PLL Filter)

¶ For emulation and normal operation, pull up EMU1 and EMU0 with a dedicated 20-kΩ resistor. For boundary scan, pull down EMU1 and EMU0 with a dedicated 20-kΩ resistor.

Signal Descriptions (Continued)

SIGNAL NAME	PIN NO.		TYPE†	DESCRIPTION

development support

TI offers an extensive line of development tools for the TMS320C6000 DSP platform, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules.

The following products support development of C6000™ DSP-based applications:

Software Development Tools:

Code Composer Studio™ Integrated Development Environment (IDE) including Editor C/C++/Assembly Code Generation, and Debug plus additional development tools Scalable, Real-Time Foundation Software (DSP/BIOS™), which provides the basic run-time target software needed to support any DSP application.

Hardware Development Tools:

Extended Development System (XDS™) Emulator (supports C6000™ DSP multiprocessor system debug) EVM (Evaluation Module)

For a complete listing of development-support tools for the TMS320C6000 DSP platform, visit the Texas Instruments web site on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL). For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

TMS320C6203B FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS086M – JANUARY 1999 – REVISED MARCH 2004

device and development-support tool nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all TMS320 DSP devices and support tools. Each TMS320 DSP commercial family member has one of three prefixes: TMX, TMP, or TMS. Texas Instruments recommends two of three possible prefix designators for support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

- TMX** Experimental device that is not necessarily representative of the final device's electrical specifications
- TMP** Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification
- TMS** Fully qualified production device

Support tool development evolutionary flow:

- TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing.
- TMDS** Fully qualified development-support product

TMX and TMP devices and TMDX development-support tools are shipped against the following disclaimer:

“Developmental product is intended for internal evaluation purposes.”

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, GLS), the temperature range (for example, blank is the default commercial temperature range), and the device speed range in megahertz (for example, -300 is 300 MHz).

Table 15 lists the device orderable part numbers (P/Ns) and Figure 4 provides a legend for reading the complete device name for any member of the TMS320C6000 DSP platform. For more information on the C6203B device orderable P/Ns, visit the Texas Instruments web site on the Worldwide web at <http://www.ti.com> URL, or contact the nearest TI field sales office or authorized distributor.

documentation support

Extensive documentation supports all TMS320 DSP family devices from product announcement through applications development. The types of documentation available include: data sheets, such as this document, with design specifications; complete user's reference guides for all devices and tools; technical briefs; development-support tools; on-line help; and hardware and software applications. The following is a brief, descriptive list of support documentation specific to the C6000 DSP devices:

The *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189) describes the C6000 CPU (DSP core) architecture, instruction set, pipeline, and associated interrupts.

The *TMS320C6000 DSP Peripherals Overview Reference Guide* (literature number SPRU190) briefly describes the functionality of the peripherals available on the C6000 DSP platform of devices, such as the 64-/32-/16-bit external memory interfaces (EMIFs), 32-/16-bit host-port interfaces (HPIs), multichannel buffered serial ports (McBSPs), direct memory access (DMA), enhanced direct-memory-access (EDMA) controller, expansion bus (XBus), peripheral component interconnect (PCI), clocking and phase-locked loop (PLL); and power-down modes.

The *How to Begin Development Today and Migrate Across the TMS320C6202/02B/03B/04 DSPs Application Report* (literature number SPRA603) describes the migration concerns and identifies the similarities and differences between the C6202, C6202B, C6203B, and C6204 C6000 DSP devices.

The *TMS320C6203, TMS320C6203B Digital Signal Processors Silicon Errata* (literature number SPRZ174) describes the known exceptions to the functional specifications for particular silicon revisions of the TMS320C6203 and TMS320C6203B devices.

The *Using IBIS Models for Timing Analysis Application Report* (literature number SPRA839) describes how to properly use IBIS models to attain accurate timing analysis for a given system.

The tools support documentation is electronically available within the Code Composer Studio™ IDE. For a complete listing of the latest C6000 DSP documentation, visit the Texas Instruments web site on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL).

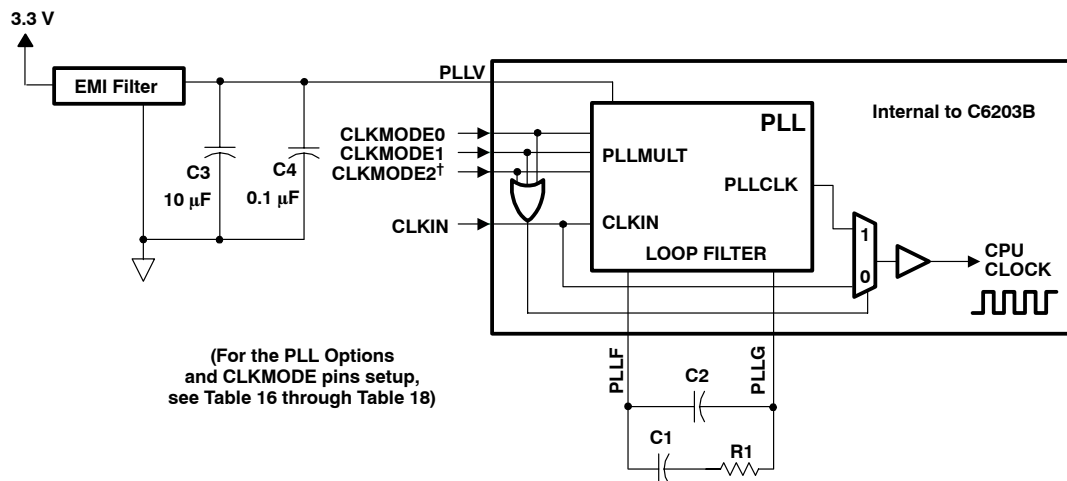

clock PLL

Most of the internal C6203B clocks are generated from a single source through the CLKIN pin. This source clock either drives the PLL, which multiplies the source clock in frequency to generate the internal CPU clock, or bypasses the PLL to become the internal CPU clock.

To use the PLL to generate the CPU clock, the external PLL filter circuit must be properly designed. Figure 5, and Table 16 through Table 18 show the external PLL circuitry for either x1 (PLL bypass) or x4 PLL multiply modes. Figure 6 shows the external PLL circuitry for a system with ONLY x1 (PLL bypass) mode.

To minimize the clock jitter, a single clean power supply should power both the C6203B device and the external clock oscillator circuit. Noise coupling into PLLF directly impacts PLL clock jitter. The minimum CLKIN rise and fall times should also be observed. For the input clock timing requirements, see the *input and output clocks* electricals section.

† The CLKMODE2 pin is not available for the C6203B GNZ package.

- NOTES:
- Keep the lead length and the number of vias between pin PLLF, pin PLLG, R1, C1, and C2 to a minimum. In addition, place all PLL components (R1, C1, C2, C3, C4, and EMI Filter) as close to the C6000 DSP device as possible. Best performance is achieved with the PLL components on a single side of the board without jumpers, switches, or components other than the ones shown.
 - For reduced PLL jitter, maximize the spacing between switching signals and the PLL external components (R1, C1, C2, C3, C4, and the EMI Filter).
 - The 3.3-V supply for the EMI filter must be from the same 3.3-V power plane supplying the I/O voltage, DV_{DD}.
 - EMI filter manufacturer: TDK part number ACF451832-333, 223, 153, 103. Panasonic part number EXCET103U.

Figure 5. External PLL Circuitry for Either PLL Multiply Modes or x1 (Bypass) Mode

TMS320C6203B FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS086M – JANUARY 1999 – REVISED MARCH 2004

clock PLL (continued)

† The CLKMODE2 pin is not available for the C6203B GNZ package.

NOTES: A. For a system with ONLY PLL x1 (bypass) mode, short the PLLF to PLLG.
B. The 3.3-V supply for PLLV must be from the same 3.3-V power plane supplying the I/O voltage, DV_{DD}.

Figure 6. External PLL Circuitry for x1 (Bypass) PLL Mode Only

‡ The CLKMODE2 pin is *not* available (N/A) for the C6203B GNZ package.

clock PLL (continued)

Table 18. TMS320C6203B PLL Component Selection Table[†]

CLKMODE [‡]	CLKIN RANGE (MHz)	CPU CLOCK FREQUENCY RANGE (MHz)	CLKOUT2 RANGE (MHz)	R1 [±1%] (Revision No.)	C1 [±10%] (Revision No.)	C2 [±10%] (Revision No.)	TYPICAL LOCK TIME (μs)
x4	32.5–75	130–300	65–150	60.4 Ω (1.x) 45.3 Ω (2.x, 3.x)	27 nF (1.x) 47 nF (2.x, 3.x)	560 pF (1.x) 10 pF (2.x, 3.x)	75
x6	21.7–50						
x7	18.6–42.9						
x8	16.3–37.5						
x9	14.4–33.3						
x10	13–30						
x11	11.8–27.3						

[†] Under some operating conditions, the maximum PLL lock time may vary by as much as 150% from the specified typical value. For example, if the typical lock time is specified as 100 μs, the maximum value may be as long as 250 μs.

[‡] CLKMODE x1, x4, x6, x7, x8, x9, x10, and x11 apply to the GLS/GNY devices. The GNZ device is restricted to x1, x4, x8, and x10 multiply factors.

power-down mode logic

Figure 7 shows the power-down logic on for the 6203B.

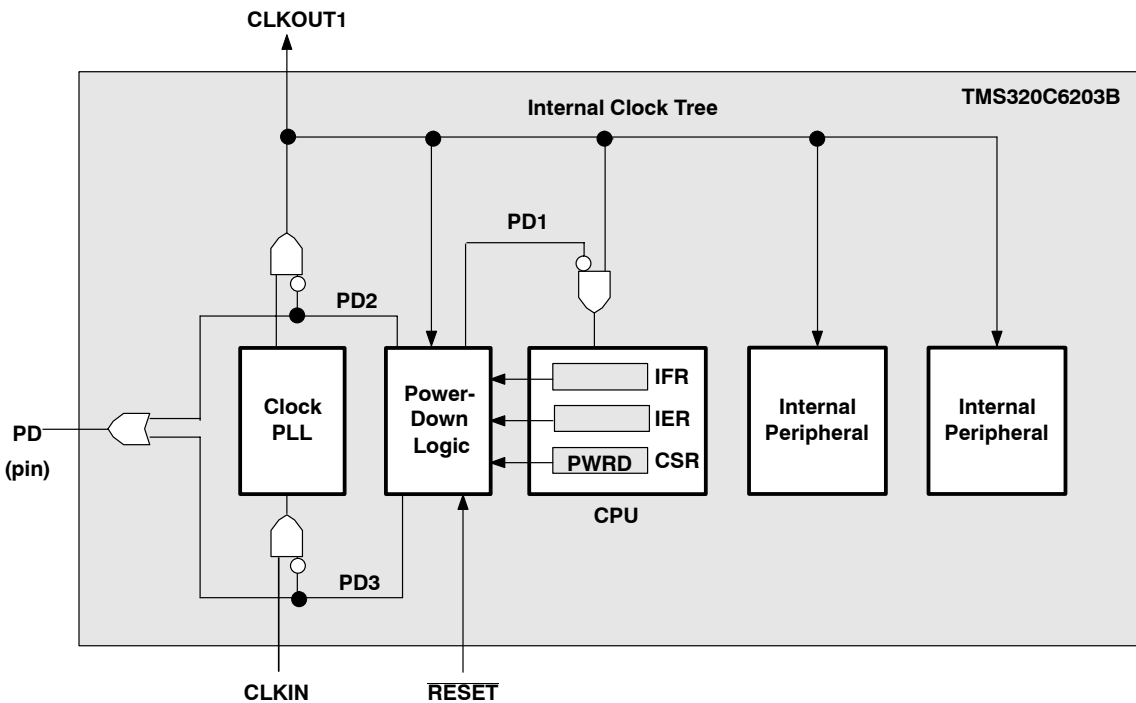

Figure 7. Power-Down Mode Logic

TMS320C6203B FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS086M – JANUARY 1999 – REVISED MARCH 2004

triggering, wake-up, and effects

The power-down modes and their wake-up methods are programmed by setting the PWRD field (bits 10–15) of the control status register (CSR). The PWRD field of the CSR is shown in Figure 8 and described in Table 19. When writing to the CSR, all bits of the PWRD field should be set at the same time. Logic 0 should be used when writing to the reserved bit (bit 15) of the PWRD field. The CSR is discussed in detail in the *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189).

Legend: R/W-x = Read/write reset value

NOTE: The shadowed bits are not part of the power-down logic discussion and therefore are not covered here. For information on these other bit fields in the CSR register, see the *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189).

Figure 8. PWRD Field of the CSR Register

Power-down mode PD1 takes effect eight to nine clock cycles after the instruction that sets the PWRD bits in the CSR.

If PD1 mode is terminated by a non-enabled interrupt, the program execution returns to the instruction where PD1 took effect. If PD1 mode is terminated by an enabled interrupt, the interrupt service routine will be executed first, then the program execution returns to the instruction where PD1 took effect. The GIE bit in CSR and the NMIE bit in the interrupt enable register (IER) must also be set in order for the interrupt service routine to execute; otherwise, execution returns to the instruction where PD1 took effect upon PD1 mode termination by an enabled interrupt.

PD2 and PD3 modes can only be aborted by device reset. Table 19 summarizes all the power-down modes.

triggering, wake-up, and effects (continued)

Table 19. Characteristics of the Power-Down Modes

PRWD BITS 15–10	POWER-DOWN MODE	WAKE-UP METHOD	EFFECT ON CHIP'S OPERATION
000000	No power-down	—	
001001	PD1	Wake by an enabled interrupt	CPU halted (except for the interrupt logic) Power-down mode blocks the internal clock inputs at the boundary of the CPU, preventing most of its logic from switching. During PD1, DMA transactions can proceed between peripherals and internal memory.
010001	PD1	Wake by an enabled or non-enabled interrupt	
011010	PD2 [†]	Wake by a device reset	Output clock from PLL is halted, stopping the internal clock structure from switching and resulting in the entire chip being halted. Signal terminal PD is driven high. All register and internal RAM contents are preserved. All functional I/O “freeze” in the last state when the PLL clock is turned off. [‡]
011100	PD3 [†]	Wake by a device reset	Input clock to the PLL stops generating clocks. Signal terminal PD is driven high. All register and internal RAM contents are preserved. All functional I/O “freeze” in the last state when the PLL clock is turned off. [†] Following reset, the PLL needs time to re-lock, just as it does following power-up. Wake-up from PD3 takes longer than wake-up from PD2 because the PLL needs to be re-locked.
other	Reserved	—	

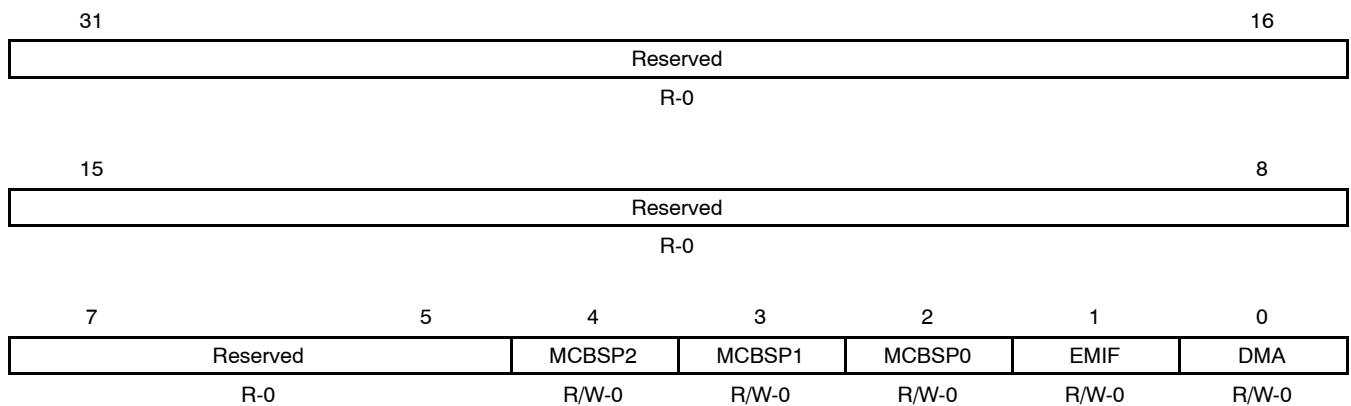

[†] On the C6203B, both the PD2 and PD3 signals assert the PD pin for external recognition of these two power-down modes.

[‡] When entering PD2 and PD3, all functional I/O will remain in the previous state. However, for peripherals which are asynchronous in nature (HPI) or peripherals with an external clock source (McBSP, XBUS, timers), output signals may transition in response to stimulus on the inputs. Peripheral operation may not perform as intended under these conditions.

peripheral power-down mode for TMS320C6203B

The C6203B has the ability to turn off clocks to individual peripherals on the device. This feature allows the user to selectively turn off peripherals which are not being used for a specific application and not pay the extra price in power consumption for unused peripherals.

The Figure 9 title displays the peripheral power down register address location and Figure 9 itself shows the register fields.

Legend: R/W-x = Read/write reset value

Figure 9. Peripheral Power-Down Control Register (PDCTL) for TMS320C6203B (019C 0200h)

TMS320C6203B FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS086M – JANUARY 1999 – REVISED MARCH 2004

peripheral power-down mode for TMS320C6203B (continued)

Table 20 lists and describes the fields in the peripheral power-down control register (PDCTL).

Table 20. Power-Down Control Register (PDCTL) Field Descriptions

BIT	FIELD	VALUE	DESCRIPTION
31–5	Reserved		Reserved. The reserved bit location is always read as zero. A value written to this field has no effect.
4	MCBSP2		Internal McBSP2 clock enable bit.
		0	Internal McBSP2 clock is enabled.
		1	Internal McBSP2 clock is disabled. McBSP2 is not functional.
3	MCBSP1		Internal McBSP1 clock enable bit.
		0	Internal McBSP1 clock is enabled.
		1	Internal McBSP1 clock is disabled. McBSP1 is not functional.
2	MCBSP0		Internal McBSP0 clock enable bit.
		0	Internal McBSP0 clock is enabled.
		1	Internal McBSP0 clock is disabled. McBSP0 is not functional.
1	EMIF		Internal EMIF clock enable bit.
		0	Internal EMIF clock is enabled.
		1	Internal EMIF clock is disabled. EMIF is not functional.
0	DMA		Internal DMA clock enable bit.
		0	Internal DMA clock is enabled.
		1	Internal DMA clock is disabled. DMA is not functional.

The user must be careful to not disable a portion of the device which is being used, since the peripheral becomes non-operational once disabled. A clock-off mode can be entered and exited depending on the needs of the application. For example, if an application does not need the serial ports, the ports can be disabled and then re-enabled when needed. While a peripheral is in power-down mode, no writes to the peripheral's registers will occur; and reads from the peripheral will produce invalid data.

When re-enabling any of the peripheral power-down bits, the CPU should wait at least 5 additional clock cycles before attempting to access that peripheral.

power-supply sequencing

TI DSPs do not require specific power sequencing between the core supply and the I/O supply. However, systems should be designed to ensure that neither supply is powered up for extended periods of time (>1 second) if the other supply is below the proper operating voltage.

system-level design considerations

System-level design considerations, such as bus contention, may require supply sequencing to be implemented. In this case, the core supply should be powered up at the same time as, or prior to (and powered down after), the I/O buffers. This is to ensure that the I/O buffers receive valid inputs from the core before the output buffers are powered up, therefore, preventing bus contention with other chips on the board.

power-supply design considerations

A dual-power supply with simultaneous sequencing can be used to eliminate the delay between core and I/O power up. A Schottky diode can also be used to tie the core rail to the I/O rail (see Figure 10).

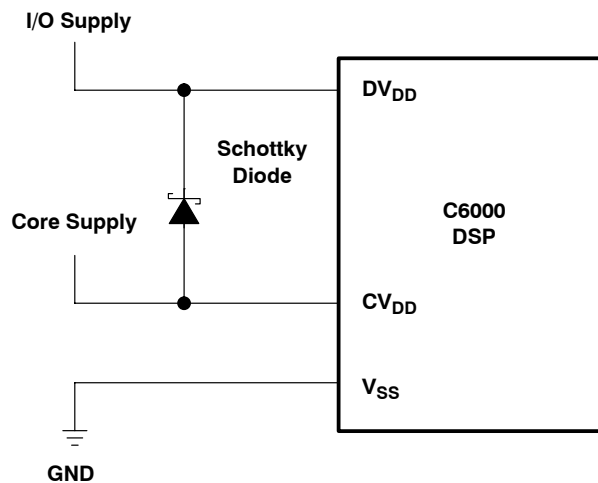

Figure 10. Schottky Diode Diagram

Core and I/O supply voltage regulators should be located close to the DSP (or DSP array) to minimize inductance and resistance in the power delivery path. Additionally, when designing for high-performance applications utilizing the C6000 platform of DSPs, the PC board should include separate power planes for core, I/O, and ground, all bypassed with high-quality low-ESL/ESR capacitors.

On systems using C62x and C67x DSPs, the core may consume in excess of 2 A per DSP until the I/O supply powers on. This extra current results from uninitialized logic within the DSP(s). A normal current state returns once the I/O power supply turns on and the CPU sees a clock pulse. Decreasing the amount of time between the core supply power-up and the I/O supply power-up reduces the effects of the current draw. If the external supply to the DSP core cannot supply the excess current, the minimum core voltage may not be achieved until after normal current returns. This voltage starvation of the core supply during power up does not affect run-time operation. Voltage starvation can affect power supply systems that gate the I/O supply via the core supply, causing the I/O supply to never turn on. During the transition from excess to normal current, a voltage spike may be seen on the core supply. Care must be taken when designing overvoltage protection circuitry on the core supply to not restart the power sequence due to this spike. Otherwise, the supply may cycle indefinitely.

TMS320C6203B

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS086M – JANUARY 1999 – REVISED MARCH 2004

IEEE 1149.1 JTAG compatibility statement

For compatibility with IEEE 1149.1 JTAG programmers, the $\overline{\text{TRST}}$ pin may need to be externally pulled up via a 1-k Ω resistor. For these C62x devices, this pin is internally pulled down, holding the JTAG port in reset by default. This is typically only a problem in systems where the DSP shares a scan chain with some other device. Some JTAG programmers for these other devices do not actively drive $\overline{\text{TRST}}$ high, leaving the scan chain inoperable while the C62x JTAG port is held in reset. TI emulators *do* drive $\overline{\text{TRST}}$ high, so the external pullup resistor is not needed in systems where TI emulators are the only devices that control JTAG scan chains on which the DSP(s) reside. If the system has other devices in the same scan chain as the DSP, and the programmer for these devices does *not* drive $\overline{\text{TRST}}$ high, then an external 1-k Ω pullup resistor is required.

With this external 1-k Ω pullup resistor installed, care must be taken to keep the DSP in a usable state under all circumstances. When $\overline{\text{TRST}}$ is pulled up, the JTAG driver must maintain the TMS signal high for 5 TCLK cycles, forcing the DSP(s) into the test logic reset (TLR) state. From the TLR state, the DSP's data scan path can be put in bypass (scan all 1s into the IR) to scan the other devices. The TLR state also allows normal operation of the DSP. If operation without anything driving the JTAG port is desired, the pullup resistor should be jumpered so that it may be engaged for programming the other devices and disconnected for running without a JTAG programmer or emulator.

absolute maximum ratings over operating case temperature ranges (unless otherwise noted)[†]

Supply voltage range, CV_{DD} (see Note 1)	- 0.3 V to 1.8 V
Supply voltage range, DV_{DD} (see Note 1)	- 0.3 V to 4 V
Input voltage range	- 0.3 V to 4 V
Output voltage range	- 0.3 V to 4 V
Operating case temperature ranges, T_C : (default)	0°C to 90°C
(A version): C6203BGNZA-250	-40°C to 105°C
Storage temperature range, T_{stg}	-65°C to 150°C
Temperature cycle range, (1000-cycle performance)	-40°C to 125°C

[†] Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: All voltage values are with respect to V_{SS} .

All rise and fall transition timing parameters are referenced to V_{IL} MAX and V_{IH} MIN for input clocks, and V_{OL} MAX and V_{OH} MIN for output clocks.

Figure 13. Rise and Fall Transition Time Voltage Reference Levels

PARAMETER MEASUREMENT INFORMATION (CONTINUED)

timing parameters and board routing analysis

The timing parameter values specified in this data sheet do *not* include delays by board routings. As a good board design practice, such delays must *always* be taken into account. Timing values may be adjusted by increasing/decreasing such delays. TI recommends utilizing the available I/O buffer information specification (IBIS) models to analyze the timing characteristics correctly. To properly use IBIS models to attain accurate timing analysis for a given system, see the *Using IBIS Models for Timing Analysis* application report (literature number SPRA839). If needed, external logic hardware such as buffers may be used to compensate any timing differences.

For inputs, timing is most impacted by the round-trip propagation delay from the DSP to the external device and from the external device to the DSP. This round-trip delay tends to negatively impact the input setup time margin, but also tends to improve the input hold time margins (see Table 21 and Figure 14).

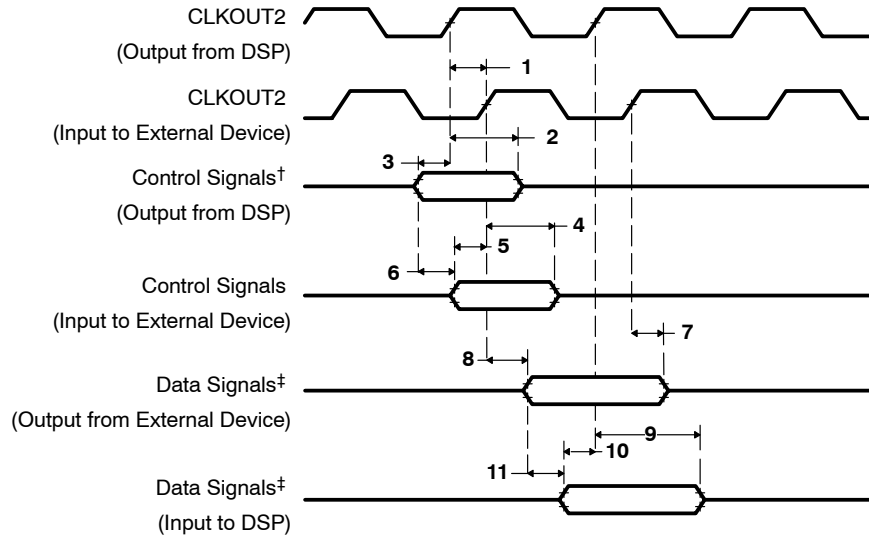

Figure 14 represents a general transfer between the DSP and an external device. The figure also represents board route delays and how they are perceived by the DSP and the external device.

Table 21. Board-Level Timings Examples (see Figure 14)

NO.	DESCRIPTION
1	Clock route delay
2	Minimum DSP hold time
3	Minimum DSP setup time
4	External device hold time requirement
5	External device setup time requirement
6	Control signal route delay
7	External device hold time
8	External device access time
9	DSP hold time requirement
10	DSP setup time requirement
11	Data route delay

Figure 14. Board-Level Input/Output Timings

INPUT AND OUTPUT CLOCKS

timing requirements for CLKIN (PLL used)^{†‡§} (see Figure 15)

NO.		-250		-300		UNIT
		MIN	MAX	MIN	MAX	
1	$t_{c(CLKIN)}$ Cycle time, CLKIN	4 * M		3.33 * M		ns
2	$t_{w(CLKINH)}$ Pulse duration, CLKIN high	0.4C		0.4C		ns
3	$t_{w(CLKINL)}$ Pulse duration, CLKIN low	0.4C		0.4C		ns
4	$t_{t(CLKIN)}$ Transition time, CLKIN	5		5		ns

[†] The reference points for the rise and fall transitions are measured at V_{IL} MAX and V_{IH} MIN.

[‡] M = the PLL multiplier factor (x4, x6, x7, x8, x9, x10, or x11) for C6203B GLS and GNY only.

M = the PLL multiplier factor (x4, x8, or x10) for C6203B GNZ only.

For more details on both devices, see the *Clock PLL* section of this data sheet.

[§] C = CLKIN cycle time in ns. For example, when CLKIN frequency is 50 MHz, use C = 20 ns.

timing requirements for CLKIN [PLL bypassed (x1)]^{†¶} (see Figure 15)

NO.		-250		-300		UNIT
		MIN	MAX	MIN	MAX	
1	$t_{c(CLKIN)}$ Cycle time, CLKIN	4		3.33		ns
2	$t_{w(CLKINH)}$ Pulse duration, CLKIN high	0.45C		0.45C		ns
3	$t_{w(CLKINL)}$ Pulse duration, CLKIN low	0.45C		0.45C		ns
4	$t_{t(CLKIN)}$ Transition time, CLKIN	0.6		0.6		ns

[†] The reference points for the rise and fall transitions are measured at V_{IL} MAX and V_{IH} MIN.

[¶] C = CLKIN cycle time in ns. For example, when CLKIN frequency is 50 MHz, use C = 20 ns. The maximum CLKIN cycle time in PLL bypass mode (x1) is 200 MHz.

SPRS086M – JANUARY 1999 – REVISED MARCH 2004

ASYNCHRONOUS MEMORY TIMING

timing requirements for asynchronous memory cycles^{†‡§¶} (see Figure 19 – Figure 22)

NO.			-250 -300		UNIT
			MIN	MAX	
3	$t_{su}(EDV-AREH)$	Setup time, EDx valid before \overline{ARE} high	1		ns
4	$t_h(AREH-EDV)$	Hold time, EDx valid after \overline{ARE} high	4.9		ns
6	$t_{su}(ARDYH-AREL)$	Setup time, ARDY high before \overline{ARE} low	-[(RST - 3) * P - 6]		ns
7	$t_h(AREL-ARDYH)$	Hold time, ARDY high after \overline{ARE} low	(RST - 3) * P + 2		ns
9	$t_{su}(ARDYL-AREL)$	Setup time, ARDY low before \overline{ARE} low	-[(RST - 3) * P - 6]		ns
10	$t_h(AREL-ARDYL)$	Hold time, ARDY low after \overline{ARE} low	(RST - 3) * P + 2		ns
11	$t_w(ARDYH)$	Pulse width, ARDY high	2P		ns
15	$t_{su}(ARDYH-AWEL)$	Setup time, ARDY high before \overline{AWE} low	-[(WST - 3) * P - 6]		ns
16	$t_h(AWEL-ARDYH)$	Hold time, ARDY high after \overline{AWE} low	(WST - 3) * P + 2		ns
18	$t_{su}(ARDYL-AWEL)$	Setup time, ARDY low before \overline{AWE} low	-[(WST - 3) * P - 6]		ns
19	$t_h(AWEL-ARDYL)$	Hold time, ARDY low after \overline{AWE} low	(WST - 3) * P + 2		ns

[†] To ensure data setup time, simply program the strobe width wide enough. ARDY is internally synchronized. If ARDY does not meet setup or hold time, it may be recognized in the current cycle or the next cycle. Thus, ARDY can be an asynchronous input.

[‡] RS = Read Setup, RST = Read Strobe, RH = Read Hold, WS = Write Setup, WST = Write Strobe, WH = Write Hold. These parameters are programmed via the EMIF CE space control registers.

[§] P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.33 ns.

[¶] The sum of RS and RST (or WS and WST) must be a minimum of 4 in order to use ARDY input to extend strobe width.

switching characteristics over recommended operating conditions for asynchronous memory cycles^{‡§¶} (see Figure 19 – Figure 22)

NO.	PARAMETER	-250 -300			UNIT	
		MIN	TYP	MAX		
1	$t_{osu}(SELV-AREL)$	Output setup time, select signals valid to \overline{ARE} low		RS * P - 2	ns	
2	$t_{oh}(AREH-SELIV)$	Output hold time, \overline{ARE} high to select signals invalid		RH * P - 2	ns	
5	$t_w(AREL)$	Pulse width, \overline{ARE} low		RST * P	ns	
8	$t_d(ARDYH-AREH)$	Delay time, ARDY high to \overline{ARE} high		3P	4P + 5	ns
12	$t_{osu}(SELV-AWEL)$	Output setup time, select signals valid to \overline{AWE} low		WS * P - 3	ns	
13	$t_{oh}(AWEH-SELIV)$	Output hold time, \overline{AWE} high to select signals invalid		WH * P - 2	ns	
14	$t_w(AWEL)$	Pulse width, \overline{AWE} low		WST * P	ns	
17	$t_d(ARDYH-AWEH)$	Delay time, ARDY high to \overline{AWE} high		3P	4P + 5	ns

[‡] RS = Read Setup, RST = Read Strobe, RH = Read Hold, WS = Write Setup, WST = Write Strobe, WH = Write Hold. These parameters are programmed via the EMIF CE space control registers.

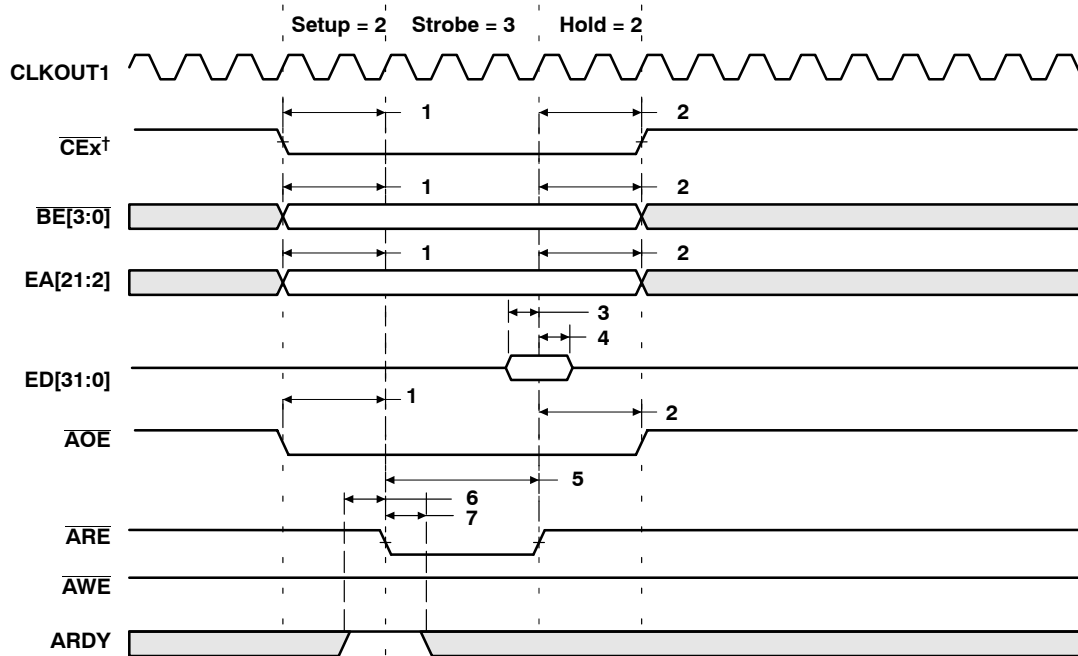

[§] P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.33 ns.

[¶] The sum of RS and RST (or WS and WST) must be a minimum of 4 in order to use ARDY input to extend strobe width.

[#] Select signals include: \overline{CEX} , $\overline{BE}[3:0]$, $\overline{EA}[21:2]$, \overline{AOE} ; and for writes, include $\overline{ED}[31:0]$, with the exception that \overline{CEX} can stay active for an additional 7P ns following the end of the cycle.

ASYNCHRONOUS MEMORY TIMING (CONTINUED)

[†] $\overline{\text{CE}}$ stays active for seven minus the value of Read Hold cycles after the last access (DMA transfer or CPU access). For example, if read HOLD = 1, then $\overline{\text{CE}}$ stays active for six more cycles. This does not affect performance, it merely reflects the EMIF's overhead.

Figure 19. Asynchronous Memory Read Timing (ARDY Not Used)

[†] $\overline{\text{CE}}$ stays active for seven minus the value of Read Hold cycles after the last access (DMA transfer or CPU access). For example, if read HOLD = 1, then $\overline{\text{CE}}$ stays active for six more cycles. This does not affect performance, it merely reflects the EMIF's overhead.

Figure 20. Asynchronous Memory Read Timing (ARDY Used)

TMS320C6203B FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS086M - JANUARY 1999 - REVISED MARCH 2004

ASYNCHRONOUS MEMORY TIMING (CONTINUED)

[†] If no write accesses are scheduled for the next cycle and write hold is set to 1 or greater, then \overline{CEx} stays active for three cycles after the value of the programmed hold period. If write hold is set to 0, then \overline{CEx} stays active for four more cycles. This does not affect performance, it merely reflects the EMIF's overhead.

Figure 21. Asynchronous Memory Write Timing (ARDY Not Used)

[†] If no write accesses are scheduled for the next cycle and write hold is set to 1 or greater, then \overline{CEx} stays active for three cycles after the value of the programmed hold period. If write hold is set to 0, then \overline{CEx} stays active for four more cycles. This does not affect performance, it merely reflects the EMIF's overhead.

HOLD/HOLDA TIMING

timing requirements for the $\overline{\text{HOLD}}/\overline{\text{HOLDA}}$ cycles[†] (see Figure 31)

NO.		-250 -300		UNIT
		MIN	MAX	
3	$t_{ch}(\overline{\text{HOLDAL}}-\overline{\text{HOLDL}})$ Output hold time, $\overline{\text{HOLD}}$ low after $\overline{\text{HOLDA}}$ low	P		ns

[†] P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.33 ns.

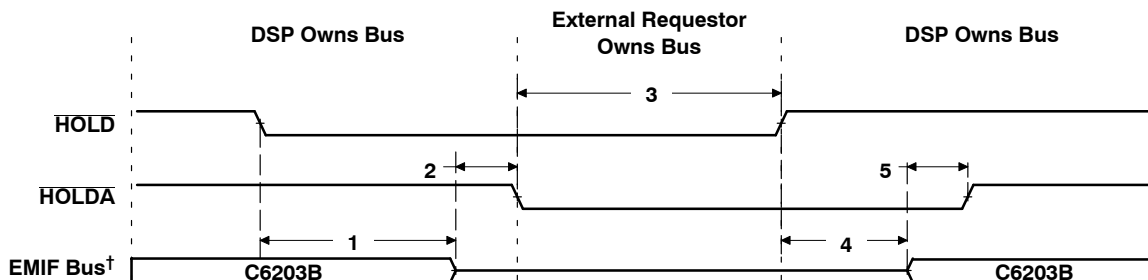

switching characteristics over recommended operating conditions for the $\overline{\text{HOLD}}/\overline{\text{HOLDA}}$ cycles^{†‡} (see Figure 31)

NO.	PARAMETER	-250 -300		UNIT
		MIN	MAX	
1	$t_d(\overline{\text{HOLDL}}-\text{EMHZ})$ Delay time, $\overline{\text{HOLD}}$ low to EMIF Bus high impedance	3P	§	ns
2	$t_d(\text{EMHZ}-\overline{\text{HOLDAL}})$ Delay time, EMIF Bus high impedance to $\overline{\text{HOLDA}}$ low	0	2P	ns
4	$t_d(\overline{\text{HOLDH}}-\text{EMLZ})$ Delay time, $\overline{\text{HOLD}}$ high to EMIF Bus low impedance	3P	7P	ns
5	$t_d(\text{EMLZ}-\overline{\text{HOLDAH}})$ Delay time, EMIF Bus low impedance to $\overline{\text{HOLDA}}$ high	0	2P	ns

[†] P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.33 ns.

[‡] EMIF Bus consists of $\overline{\text{CE}}[3:0]$, $\overline{\text{BE}}[3:0]$, $\overline{\text{ED}}[31:0]$, $\overline{\text{EA}}[21:2]$, $\overline{\text{ARE}}$, $\overline{\text{AOE}}$, $\overline{\text{AWE}}$, $\overline{\text{SDCAS}}/\overline{\text{SSADS}}$, $\overline{\text{SDRAS}}/\overline{\text{SSOE}}$, $\overline{\text{SDWE}}/\overline{\text{SSWE}}$, and $\overline{\text{SDA10}}$.

[§] All pending EMIF transactions are allowed to complete before $\overline{\text{HOLDA}}$ is asserted. The worst case for this is an asynchronous read or write with external ARDY used or a minimum of eight consecutive SDRAM reads or writes when $\text{RBTR8} = 1$. If no bus transactions are occurring, then the minimum delay time can be achieved. Also, bus hold can be indefinitely delayed by setting $\text{NOHOLD} = 1$.

[†] EMIF Bus consists of $\overline{\text{CE}}[3:0]$, $\overline{\text{BE}}[3:0]$, $\overline{\text{ED}}[31:0]$, $\overline{\text{EA}}[21:2]$, $\overline{\text{ARE}}$, $\overline{\text{AOE}}$, $\overline{\text{AWE}}$, $\overline{\text{SDCAS}}/\overline{\text{SSADS}}$, $\overline{\text{SDRAS}}/\overline{\text{SSOE}}$, $\overline{\text{SDWE}}/\overline{\text{SSWE}}$, and $\overline{\text{SDA10}}$.

Figure 31. $\overline{\text{HOLD}}/\overline{\text{HOLDA}}$ Timing

RESET TIMING

timing requirements for reset[†] (see Figure 32)

NO.			-250 -300		UNIT
			MIN	MAX	
1	$t_{w(RST)}$	Width of the \overline{RESET} pulse (PLL stable) [‡]	10P		ns
		Width of the \overline{RESET} pulse (PLL needs to sync up) [§]	250		μ s
10	$t_{su(XD)}$	Setup time, XD configuration bits valid before \overline{RESET} high [¶]	5P		ns
11	$t_{h(XD)}$	Hold time, XD configuration bits valid after \overline{RESET} high [¶]	5P		ns

[†] P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.33 ns.

[‡] This parameter applies to CLKMODE x1 when CLKIN is stable, and applies to CLKMODE x4, x6, x7, x8, x9, x10, and x11 when CLKIN and PLL are stable for C6203B GLS and GNY devices. And applies to CLKMODE x4, x6, x8, and x10 when CLKIN and PLL are stable for C6203B GNZ devices.

[§] This parameter applies to CLKMODE x4, x6, x7, x8, x9, x10, and x11 only (it does not apply to CLKMODE x1) for C6203B GLS and GNY devices. This parameter applies to CLKMODE x4, x6, x8, and x10 only (it does not apply to CLKMODE x1) for C6203B GNZ devices. The \overline{RESET} signal is not connected internally to the clock PLL circuit. The PLL, however, may need up to 250 μ s to stabilize following device power up or after PLL configuration has been changed. During that time, \overline{RESET} must be asserted to ensure proper device operation. See the *Clock PLL* section for PLL lock times.

[¶] XD[31:0] are the boot configuration pins during device reset.

18	$t_{su}(XRDYL-XWEL)$	Setup time, XRDY low before \overline{XWE} low	-[(WST - 3) * P - 6]		ns
19	$t_h(XWEL-XRDYL)$	Hold time, XRDY low after \overline{XWE} low	(WST - 3) * P + 2		ns

[†] To ensure data setup time, simply program the strobe width wide enough. XRDY is internally synchronized. If XRDY does not meet setup or hold time, it may be recognized in the current cycle or the next cycle. Therefore, XRDY can be an asynchronous input.

[‡] RS = Read Setup, RST = Read Strobe, RH = Read Hold, WS = Write Setup, WST = Write Strobe, WH = Write Hold. These parameters are programmed via the XBUS XCE space control registers.

[§] P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.3 ns.

[¶] The sum of RS and RST (or WS and WST) must be a minimum of 4 in order to use XRDY input to extend strobe width.

switching characteristics over recommended operating conditions for asynchronous peripheral cycles^{‡§¶} (see Figure 37–Figure 40)

NO.	PARAMETER	-250 -300			UNIT

MULTICHANNEL BUFFERED SERIAL PORT TIMING

timing requirements for McBSP^{†‡} (see Figure 50)

NO.				-250 -300		UNIT
				MIN	MAX	
2	$t_c(\text{CKRX})$	Cycle time, CLKR/X	CLKR/X ext	2P [§]		ns
3	$t_w(\text{CKRX})$	Pulse duration, CLKR/X high or CLKR/X low	CLKR/X ext	P – 1 [¶]		ns
5	$t_{su}(\text{FRH-CKRL})$	Setup time, external FSR high before CLKR low	CLKR int	9		ns
			CLKR ext	2		
6	$t_h(\text{CKRL-FRH})$	Hold time, external FSR high after CLKR low	CLKR int	6		ns
			CLKR ext	3		
7	$t_{su}(\text{DRV-CKRL})$	Setup time, DR valid before CLKR low	CLKR int	8		ns
			CLKR ext	0.5		
8	$t_h(\text{CKRL-DRV})$	Hold time, DR valid after CLKR low	CLKR int	3		ns
			CLKR ext	4.5		
10	$t_{su}(\text{FXH-CKXL})$	Setup time, external FSX high before CLKX low	CLKX int	9		ns
			CLKX ext	2		
11	$t_h(\text{CKXL-FXH})$	Hold time, external FSX high after CLKX low	CLKX int	6		ns
			CLKX ext	4		

[†] CLKRP = CLKXP = FSRP = FSXP = 0. If the polarity of any of the signals is inverted, then the timing references of that signal are also inverted.

[‡] P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.3 ns.

[§] The maximum bit rate for the C6203B device is 100 Mbps or CPU/2 (the slower of the two). Care must be taken to ensure that the AC timings specified in this data sheet are met. The maximum bit rate for McBSP-to-McBSP communications is 100 MHz; therefore, the minimum CLKR/X clock cycle is either twice the CPU cycle time (2P), or 10 ns (100 MHz), whichever value is larger. For example, when running parts at 300 MHz (P = 3.3 ns), use 10 ns as the minimum CLKR/X clock cycle (by setting the appropriate CLKGDV ratio or external clock source). When running parts at 100 MHz (P = 10 ns), use 2P = 20 ns (50 MHz) as the minimum CLKR/X clock cycle. The maximum bit rate for McBSP-to-McBSP communications applies when the serial port is a master of the clock and frame syncs (with CLKR connected to CLKX, FSR connected to FSX, CLKXM = FSXM = 1, and CLKRM = FSRM = 0) in data delay 1 or 2 mode (R/XDATDLY = 01b or 10b) and the other device the McBSP communicates to is a slave.

[¶] The minimum CLKR/X pulse duration is either (P – 1) or 4 ns, whichever is larger. For example, when running parts at 300 MHz (P = 3.3 ns), use 4 ns as the minimum CLKR/X pulse duration. When running parts at 100 MHz (P = 10 ns), use (P – 1) = 9 ns as the minimum CLKR/X pulse duration.

REVISION HISTORY

This data sheet revision history highlights the technical changes made to the SPRS086L device-specific data sheet to make it an SPRS086M revision.

Scope: Applicable updates to the C62x device family, specifically relating to the C6203/B devices, have been incorporated.

PAGE(S) NO.	ADDITIONS/CHANGES/DELETIONS
10	memory map summary: Changed the document reference in the last sentence of the paragraph.
11	peripheral register descriptions: Updated the information regarding the document reference.
15	DMA synchronization events: Updated the information regarding the document reference.
16	Table 14, C6202/02B DSP Interrupts: Changed the document reference in the second footnote to: TMS320C6000 DSP Interrupt Selector Reference Guide (literature number SPRU646)
38	Figure 8, PWRD Field of the CSR Register: Updated the PD1, PD2, and PD3 information that follows Figure 8.
48	switching characteristics over recommended operating conditions for CLKOUT2 table: Removed NO. 1 (parameter $t_{c(CKO2)}$) from the table.

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
