## TS2904

Preliminary
Dual Operational Amplifier

Pin assignment:

1. Output
2. Input A (-)
3. Input A (+)
4. Gnd
5. Input B (+)
6. Input B (-)
7. Output B
8. Vcc

# Supply Voltage Range 3V to 26V 

Dual Channel Amplifier

## General Description

Utilizing the circuit designs perfected for recently introduced Quad Operational Amplifiers, these dual operational amplifiers have several distinct advantages over standard operational amplifier types in single supply applications. They can operate at supply voltages as low as 3.0 Volts or as high as 26 Volts with quiescent currents about one fifth of those associated with the LM741 (on a pet amplifier basis). The common mode input range includes the negative supply, thereby eliminating the necessity for external biasing components in many applications.
The TS2904 is equivalent to one half of TS2902, and output voltage range also includes the negative supply voltage. The TS2904 is offered in 8 pin SOP-8 and DIP-8 package.

## Features

> Short circuit protected outputs
« True differential input stage
« Single supply operation: 3V to 26 V
$\diamond \quad$ Low input bias currents
» Internally compensated
$\diamond \quad$ Common mode range extends to negative supply
\& Single and split supply operation
< Similar performance to the popular MC1558

## Block Diagram

$\operatorname{Pin} 4=$ Gnd $\operatorname{Pin} 8=V c c$

## Ordering Information

| Part No. | Operating Temp. | Package |
| :---: | :---: | :---: |
| TS2904CD | $-40 \sim+105^{\circ} \mathrm{C}$ | DIP-8 |
| TS2904CS |  | SOP-8 |

## Absolute Maximum Rating

| Supply Voltage | Vcc | 26 | V |
| :--- | :---: | :---: | :---: |
| Differential Input Voltage (note 1) | $\mathrm{V}_{\text {IDR }}$ | 26 | V |
| Input Common Mode Voltage Range (note 2) | $\mathrm{V}_{\text {ICR }}$ | -0.3 to 26 | V |
| Input Forward Current (note 3) | lif | 50 | mA |
| Output Short Circuit Duration | Isc | Continuous | mA |
| Power Dissipation @ Ta $=25^{\circ} \mathrm{C}$ |  | 570 | mW |
| Derate above $25^{\circ} \mathrm{C}$ | $1 / \mathrm{R} \theta \mathrm{ja}$ | 5.7 | $\mathrm{~mW} /{ }^{\circ} \mathrm{C}$ |
| Operating Junction Temperature Range | $\mathrm{T}_{\mathrm{J}}$ | $0 \sim+125$ | ${ }^{\circ} \mathrm{C}$ |
| Storage Temperature Range | $\mathrm{T}_{\text {STG }}$ | $-65 \sim+150$ | ${ }^{\circ} \mathrm{C}$ |
| NOTE |  |  |  |

## NOTE :

1. Split Power Supplies.
2. For supply. Voltages less than 26 V for the TS2904 the absolute maximum input voltage is equal to the supply voltage.
3. This input current will only exist when the voltage is negative at any of the input leads. Normal output states will reestablish when the input voltage returns to a voltage greater than -0.3 V .

Electrical Characteristics

## Notes:

1. The input common mode voltage or either input signal voltage should not be allowed to go negative by more than 0.3 V . The upper end of the common mode voltage range is Vcc 17 V , but either or both inputs can go to +26 V .
2. Short circuits from the output to Vcc can cause excessive heating and eventual destruction. Destructive dissipation can recruit from simultaneous shorts on all amplifiers.

## Circuit Description

The TS2904 made using two internally compensated, two-stage operational amplifiers. The first stage performs not only the first stage gain function but also performs the level shifting and transconductance reduction functions. By reducing the transconductance, a smaller compensation capacitor (only 5.0 pF ) can be employed, thus saving chip area. Another feature of this input stage is that the input common mode range can include the negative supply or ground, in single supply operation, without saturating either the input devices or the differential to single-ended converter. The second stage consists of a standard current source load amplifier stage.
Each amplifier is biased from an internal-voltage regulator, and which has a low temperature coefficient thus giving each amplifier good temperature characteristics as well as excellent power supply rejection.

> VinL= R1 /(R1 + R2) * (Vol - Vref $)+$ Vref
> VinH=R1/(R1 + R2) * (Voh - Vref $)+$ Vref

$$
H=R 1 /(\text { R1 + R2 }) *(\text { Voh }-\mathrm{Vol})
$$

Figure 11. comparator with hysteresis

Figure 12. function generator

Given: fo= center frequency

$$
\mathrm{A}(\mathrm{fo})=\text { gain at center frequency }
$$

Choose value fo, $C$
Then: $\mathrm{R} 3=\mathrm{Q} / \pi$ fo C

$$
\begin{aligned}
& \text { R1 }=\text { R3 / 2A(fo) } \\
& \text { R2=R1 *R2 / 4Q2 *R1-R3 }
\end{aligned}
$$

For less than 10\% error from operational amplifier, Qo fo / BW < 0.1
Where fo and BW are expressed in Hz
If source impendance varies, filter may be preceded with Voltage follower buffer stabilize filter parameters
