μ PC8112TB

SILICON MMIC 1st FREQUENCY DOWN-CONVERTER FOR CELLULAR/CORDLESS TELEPHONE

DESCRIPTION

The μ PC8112TB is a silicon monolithic integrated circuit designed as 1st frequency down-converter for cellular/cordless telephone receiver stage. This IC consists of mixer and local amplifier. The μ PC8112TB features high impedance output of open collector. Similar ICs of the μ PC2757TB and μ PC2758TB feature low impedance output of emitter follower. These TB suffix ICs which are smaller package than conventional T suffix ICs contribute to reduce your system size.

The μ PC8112TB is manufactured using NEC's 20 GHz f_T NESAT™III silicon bipolar process. This process uses silicon nitride passivation film and gold electrodes. These materials can protect chip surface from external pollution and prevent corrosion/migration. Thus, this IC has excellent performance, uniformity and reliability.

μPC8112's ΔIM₃ is closer to 3 (theoretical inclination) than μPC2757 and μPC2758 of conventional ICs.

NOTE ON CORRECT USE

- (1) Observe precautions for handling because of electro-static sensitive devices.
- (2) Form a ground pattern as widely as possible to minimize ground impedance (to prevent undesired oscillation).
Keep the track length of the ground pins as short as possible.
- (3) The bypass capacitor (e.g. 1 000 pF) should be attached to the V_{CC} pin.
- (4) The matching circuit should be externally attached to the IF output pin.
- (5) The DC cut capacitor must be each attached to the input and output pins.
