## DUAL TIMER

### DESCRIPTION

The UTC NE556 dual monolithic circuit is a highly stable controller capable of producing accurate delays or oscillation. The UTC NE556 is the dual of UTC NE555; timing is provided an external resistor and capacitor for each function. The two timers operate independently of each other, sharing only Vcc and GND. The circuits may be triggered and reset on falling wave forms. The output structures may sink or source 200mA.

### FEATURES

- \*High current driver capability(=200mA)
- \*Adjustable duty cycle
- \*Timing from  $\mu$ Sec to Hours
- \*Temperature stability of 0.005%/ $^{\circ}$ C
- \*TTL compatible
- \*Operates in both Astable and Monostable modes

### APPLICATIONS

- \*Precision timing.
- \*Pulse generator, shaping.
- \*Time delay generator.
- \*Sequential timing.
- \*Pulse width modulation.
- \*Traffic light control.
- \*Touch tone encoder.
- \*Tone burst generator.

Note 1: Supply current when output is high is typically 1mA less at V<sub>cc</sub> 5V.

Note 2: Tested at V<sub>cc</sub>=5V and V<sub>cc</sub>=15V.

Note 3: This will determine the maximum value of RA+RB for 15V operation, The maximum total is R=20MΩ, and for 5V operation the maximum total is R=6.6MΩ.

Note 4: As reset voltage lower, timing is inhibited and then the output goes low.

Note 5: Matching parameters refer to the difference between performance parameters of each timer section in the monostable mode.
